Organizations and Individuals Responsible for TIMSS 2011

## Foreword

In both technologically advanced and developing economies, understanding educational outcomes is central to effective educational planning and reform. Further, in today's global innovation economy, competence in mathematics and science remains an educational imperative.

For more than 50 years, the International Association for the Evaluation of Educational Achievement (IEA) has been conducting comparative studies of educational achievement in a number of curriculum areas, including mathematics and science. TIMSS 2011 represents the fifth cycle of the Trends in International Mathematics and Science Study (TIMSS), developed by IEA. During the past two decades, TIMSS has reported on mathematics and science achievement trends at the fourth and eighth grades, providing educational policymakers, administrators, teachers, and researchers with powerful insights into how educational systems are functioning as well as critical intelligence about the possibilities for educational reform and improvement.

The TIMSS 2011 International Results in Mathematics presents extensive information on student performance in mathematics, including trends over the five assessments since 1995. Also included are data on performance in the mathematics content domains (algebra, geometry, etc.) and
on competence in managing the problem solving challenges in these mathematical contexts. In addition, the TIMSS 2011 report contains vital information on key curricular, instructional, and resource-related factors that can impact the teaching and learning process. These data on student achievement trends and the contexts for teaching and learning mathematics will ensure that TIMSS continues to set the standard for studies of this type and be regarded as a fundamental source of information for educational policymakers, planners, and researchers alike.

TIMSS requires and represents a significant commitment of resources and dedication to achieve a common vision. Clearly, projects of this magnitude rely on the cooperation and support of a large number of individuals, institutions, and organizations around the world. IEA is particularly indebted to the staff members of the TIMSS \& PIRLS International Study Center at Boston College, who have been charged with the overall leadership of this project. Their contributions have been augmented by the staff of the IEA Data Processing and Research Center, the IEA Secretariat, Statistics Canada, and Educational Testing Service, for whose support I am also extremely grateful. While the work of the staff of this consortium makes projects like TIMSS possible, the continued leadership and direction of the TIMSS Executive Directors Ina Mullis and Michael Martin remain central to the success of this project.

In addition, projects of this size are possible only with considerable financial support. I am particularly grateful for support from IEA’s major funding partners, including the US National Center for Education Statistics, the World Bank, and the many self-funding countries without which this project would not have been possible. I also wish to thank Boston College for its continued support of the TIMSS \& PIRLS International Study Center.

Finally, as always, TIMSS would not have been possible without the National Research Coordinators and their colleagues, whose responsibility it was to manage the study at the local level, and the participation of the many teachers, students, and policymakers around the world who gave freely of their time in the interest of advancing our common understanding of reading achievement. On behalf of all who benefit from the use of the information provided by TIMSS, we are thankful for this commitment.

Hans Wagemaker
Executive Director, IEA

## Executive Summary

TIMSS is an international assessment of mathematics and science at the fourth and eighth grades that has been conducted every four years since 1995. In 2011, nationally representative samples of students in 63 countries and 14 benchmarking entities (regional jurisdictions of countries, such as states) participated in TIMSS. Countries and benchmarking participants could elect to participate in the fourth grade assessment, the eighth grade assessment, or both: fifty-two countries and seven benchmarking entities participated in the fourth grade assessment, and 45 countries and 14 benchmarking entities participated in the eighth grade assessment. Several of the countries, where fourth and eighth grade students were expected to find the TIMSS assessments too difficult, administered the fourth and eighth grade assessments to their sixth and ninth grade students.

In total, more than 600,000 students participated in TIMSS 2011. TIMSS 2011 continues the series of international assessments in mathematics and science conducted by the International Association for the Evaluation of Educational Achievement (IEA).

IEA pioneered international comparative assessments of educational achievement in the 1960s to gain a deeper understanding of the effects of policies and practices across countries' different systems of education. TIMSS is directed by IEA’s TIMSS \& PIRLS International Study Center at Boston College.

This TIMSS 2011 report summarizes the mathematics achievement results of fourth and eighth grade students in countries around the world, and provides trends over the five assessments since 1995. As a complement to this volume, TIMSS 2011 International Results in Science summarizes fourth and eighth grade students' science achievement in each of the 63 countries and 14 benchmarking participants.

The TIMSS mathematics assessment is based on a comprehensive framework developed collaboratively with the participating countries that is organized around two dimensions:

- A content dimension specifying the domains or subject matter to be assessed within mathematics; and
- A cognitive dimension specifying the domains or thinking processes expected of students as they engage with the mathematics content.
The content domains and topic areas within them are different for the fourth and eighth grades, but the cognitive domains are the same for both grades, encompassing a range of cognitive processes involved in solving problems

throughout the primary and middle school years.

Given the frameworks' broad coverage goals, the mathematics assessment item pools were necessarily large-175 and 217 assessment items at the fourth and eighth grades, respectively—with about half being multiple choice and half being constructed response items where students write their answers. The achievement results are reported on the TIMSS achievement scales for the fourth and eighth grades, each with a range of $0-1,000$ (although student performance typically ranges between 300 and 700). TIMSS uses the centerpoint of the scale (500) as a point of reference that remains constant from assessment to assessment.

## East Asian Countries Are Top-performers in TIMSS 2011

East Asian countries continue to lead the world in mathematics achievement. Singapore, Korea, and Hong Kong SAR, followed by Chinese Taipei and Japan, were the top-performing countries at the fourth grade. Similarly, at the eighth

Top-performing Countries in TIMSS 2011

| Fourth Grade | Eighth Grade |
| :---: | :---: |
| Singapore | Korea |
| Korea | Singapore |
| Hong Kong SAR | Chinese Taipei |
| Chinese Taipei | Hong Kong SAR |
| Japan | Japan | grade, Korea, Singapore, and Chinese Taipei outperformed all other countries, followed by Hong Kong SAR and Japan.

In addition to the five top-performers at the fourth grade, Northern Ireland, Belgium (Flemish), Finland, England, and the Russian Federation rounded out the top ten highachieving countries. The US states of Florida and North Carolina had performance similar to these countries. At the eighth grade, the Russian Federation, Israel, Finland, the United States, and England also were included in the top ten high-achieving countries. The US states of Massachusetts, Minnesota, and North Carolina and the Canadian province of Québec also had high achievement, but lower than the East Asian countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lowerperforming countries. Twenty-two countries at the fourth grade and the three assessing their sixth grade students had average achievement below the TIMSS scale centerpoint of 500, as did two benchmarking participants. At the eighth grade, 27 countries and the three assessing their ninth grade students had average achievement below 500, as did three benchmarking participants.

## Fourth Grade Shows More Increases Than Decreases, but Not Eighth Grade

At the fourth grade, 17 countries and three benchmarking participants have comparable data from 1995 and 2011, providing trends over the past 16 years. Since 1995, twelve of these countries raised their levels of mathematics achievement and only three had decreases. Among the benchmarking participants, the Canadian province of Ontario increased achievement and

| Countries Improving | Countries Declining |
| :---: | :---: |
| Australia | Austria |
| England | Czech Republic |
| Hong Kong SAR | Netherlands |

| Norway |  |
| Portugal |  |
| Singapore |  |
| Slovenia |  |
| United States |  |

*The 1999 assessment only was given at the eighth grade, and a number of countries joined at that time.
the province of Québec decreased achievement between 1995 and 2011.

At the eighth grade, there was more balance between mathematics achievement growth and decline among countries. Of the 25 countries and eight benchmarking participants with comparable data spanning 1995 or 1999 to 2011, nine countries had increased achievement and eleven countries had decreased achievement. In addition, four benchmarking participants had increased achievement-the Canadian province of Ontario and the US states of Massachusetts, Minnesota, and North Carolina-while two had decreased achievement-the Canadian provinces of Alberta and Québec.

| Low |
| - Some knowledge of whole |
| numbers and decimals, |
| operations, and basic graphs. |

## Trends at TIMSS International Benchmarks

TIMSS reports achievement at four points along the scale as international benchmarks: Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400).

At the fourth grade, reflecting the upward trends in average achievement, there were more improvements across the International Benchmarks in 2011 than there were declines. Remarkably, only one country showed decreases in achievement at all four benchmarks between 1995 and 2011, and nine countries showed improvement at all four benchmarks, raising the level of performance across the entire distribution of student achievement.

Reflecting less improvement across countries at the eighth grade, three countries declined since 1995 at all four benchmarks (Hungary, Sweden, and Norway), and only three countries improved at all four benchmarks.

## Very High Percentages of East Asian Students Reach TIMSS International Benchmarks

At both the fourth and eighth grades, the five East Asian countries had the largest percentages of students reaching the TIMSS International Benchmarks, and the gaps were especially large at the highest levels.

At the fourth grade, Singapore had 43 percent of their students reach the TIMSS Advanced International Benchmark, followed by Korea, Hong Kong SAR, Chinese Taipei, and Japan, all with 30 percent or more. Northern Ireland was next with 24 percent, then England with 18 percent. These five Asian countries also had from 70 to 80 percent reach the High Intermediate Benchmark (again, Northern Ireland was next, but with 59\%), and 93 percent or more reach the Intermediate International Benchmark (Belgium, Flemish had $89 \%$ and the Netherlands $88 \%$ ). Although Belgium (Flemish) and the Netherlands had fewer students reaching the highest benchmarks than did the top-performing Asian countries, they had nearly as many reaching the Intermediate level and just as many reaching the Low level.

| Percentages of East Asian Students Reaching International Benchmarks in TIMSS 2011, Fourth Grade |  |  |  |
| :---: | :---: | :---: | :---: |
| Advanced 30\% or More | High 70\% or More | Intermediate 93\% or More | Low 99\% or More |
| 43\% Singapore | 80\% Korea | 97\% Korea | 100\% Korea |
| 39\% Korea | 80\% Hong Kong SAR | 96\% Hong Kong SAR | 99\% Singapore |
| 37\% Hong Kong SAR | 78\% Singapore | 94\% Singapore | 99\% Hong Kong SAR |
| 34\% Chinese Taipei | 74\% Chinese Taipei | 93\% Chinese Taipei | 99\% Chinese Taipei |
| 30\% Japan | 70\% Japan | 93\% Japan | 99\% Japan |
|  |  |  | 99\% Belgium (Flemish) |
|  |  |  | 99\% Netherlands |
| Next Highest Percentage |  |  |  |
| 24\% Northern Ireland | 59\% Northern Ireland | 89\% Belgium (Flemish) | 98\% Finland |

At the eighth grade, clearly the East Asian countries, particularly Chinese Taipei, Singapore, and Korea, are pulling away from the rest of the world by a considerable margin. Capitalizing on the head start demonstrated by their fourth grade students, these same five East Asian countries had by far the largest percentages of eighth grade students reaching the Advanced International Benchmark. Very impressively, Chinese Taipei, Singapore, and Korea had nearly half of their students (47-49\%) reach the Advanced International Benchmark. Hong Kong SAR had about one-third (34\%) reach this level, and Japan had over

one-fourth (27\%). Next, the Russian Federation and Israel had 14 and 12 percent, respectively. At the High International Benchmark, Japan (61\%) trailed the other four Asian high achievers (71-78\%), but the next highest were the Russian Federation and Israel with less than half (40-47\%) achieving at the high level. At the Intermediate International Benchmark, the Russian Federation (78\%) followed the five top-performers (87-93\%), and at the Low International Benchmark Finland and the Russian Federation joined the five East Asian countries (with 95-99\%), followed by Slovenia (93\%).

## More Countries Demonstrate Relative Strength in Knowing Mathematics than Applying and Reasoning

Generally, the TIMSS 2011 participants with the highest achievement overall also had the highest achievement across the content and cognitive demands. However, many countries performed relatively higher in one or two of the content domains compared, to their overall performance, and relatively lower in one or two others.

Internationally, the fewest countries showed relative strength in geometry. For example, at the eighth grade, many countries (25) had relatively higher achievement in algebra than they did overall, and far fewer (only 10) had relatively higher achievement in geometry.

Across the fourth and eighth grades, more countries demonstrated relative strengths in knowing mathematics (i.e., recalling, recognizing, and computing) than in applying mathematical knowledge and reasoning.

## Early Start Crucial in Developing Children's Mathematics Achievement

An early start is crucial in shaping children's numeracy skills. In TIMSS 2011, at the fourth and sixth grades, and for the benchmarking participants, students had higher mathematics achievement if their parents reported that:

- They often engaged in early numeracy activities with their children;
- Their children had attended preprimary education; and
- Their children started school able to do early numeracy tasks
(e.g., simple addition and subtraction).

There is increasing evidence that participating in numeracy activities as well as literacy activities during the preschool years can have beneficial effects on children's later acquisition of numeracy skills. To examine students' early home experiences, TIMSS includes an Early Numeracy Activities scale based on parents' reports about the frequency of having done six activities with their child, such as playing with number toys, counting things, and playing number or card games. Internationally, the 49 percent of students whose parents Often engaged them had higher average achievement than the students whose parents only Sometimes (60\%) engaged them, and the small percentage of students whose parents Almost Never did any of the activities with them had the lowest average
 mathematics achievement.

Preprimary education, in the form of preschool, kindergarten, or an early childhood education program, plays an important role in preparing children for primary school. Besides giving students an early start in school and life, preprimary education provides an avenue for overcoming children's disadvantages and can help to break the generational cycles of poverty and low achievement. According to the TIMSS 2011 Encyclopedia, some countries already have mandatory preprimary education and some have nearly 100 percent enrollment, even though attendance is not mandatory. Of course, school policies of entering primary school at older ages permit opportunities for more years of preschool attendance than when children start primary school at younger ages.

Although attendance in preprimary education differed dramatically from country to country, on average, the fourth grade students with at least three years of preprimary education ( $43 \%$ ), or even more than one year (33\%), had higher average achievement than their counterparts with only one year or less of preprimary education. Most notably, the 13 percent of students, on average, that did not attend preschool had much lower average mathematics achievement.

Considering that 1) parents are children's first teachers and many parents have concentrated on numeracy skills, and that 2) substantial percentages of children in some countries have attended several years of preprimary

| Students Could Do Early Numeracy Tasks When Began Primary SchoolInternational Averages |  |  | TIMSS $20114^{\text {th }}$ Mathematics Grade |
| :---: | :---: | :---: | :---: |
|  | Very Well | Moderately Well | Not Well |
| Average Percentage of Students | 25\% | 71\% | 4\% |
|  | 524 | $492$ | $451$ | education, it is not surprising that many children begin primary school with some numeracy skills. TIMSS included the Early Numeracy Tasks scale based on parents' assessments of how well their children could do six early numeracy tasks (e.g., simple addition and subtraction) upon entering school. Parents' assessments of their children's initial numeracy skills corresponded well

with mathematics achievement at the fourth and sixth grades, and among benchmarking participants. For example, mathematics achievement at the fourth grade was substantially higher for the one-quarter of students whose parents reported their children could perform the activities Very Well, next highest for the 71 percent whose parents reported Moderately Well, and much lower for the few whose parents reported Not Well.

## Home Resources Strongly Related to Mathematics Achievement

Research consistently shows a strong positive relationship between achievement and indicators of socioeconomic status, such as parents' or caregivers' level of education. At the fourth and sixth grades, TIMSS used the parents' reports on the availability of key home resources to create the Home Resources for Learning scale, including parents' education, parents' occupation, books in the home, and study supports. Internationally, on average, the 17 percent of students with Many Resources had substantially higher mathematics achievement than the nine percent with Few Resources-
a 119-point difference. However, almost three-quarters of the fourth grade students (74\%) had Some Resources.

At the eighth and ninth grades, TIMSS asked the students themselves about their parents' education, books in the home, and study supports, with similar results. Internationally, the twelve percent of eighth grade students with Many Resources had the highest average achievement, the two-thirds with Some Resources had the next highest achievement, and the one-fifth with Few Resources had the lowest average achievement.

## Successful Schools Tend to Be Well-resourced

Ever since the Coleman report in 1966, researchers have recognized that the compositional characteristics of a school's student body can affect student achievement. To provide information on this topic, TIMSS routinely asks school principals to report on their students' economic home backgrounds and home language. While there was variation across countries, higher average mathematics achievement was associated with students attending schools where a greater percentage of students had the following characteristics:

- Were from relatively affluent socioeconomic backgrounds; and
- Spoke the language of the TIMSS assessment as their first language.

For example, students were distributed relatively equally across three types of schools categorized by the affluence of their home backgrounds. At the fourth grade, 36 percent attended schools with relatively more students from

School Composition by Student Home Economic

affluent than from economically disadvantaged homes, and these students had the highest average achievement. At the other end of the range, 30 percent of students attended schools with relatively more students from economically disadvantaged homes, and these students had the lowest average achievement.

Similarly, at the eighth grade, 32 percent attended schools with relatively more students from affluent than disadvantaged homes, and these students had the highest average achievement. Conversely, 36 percent of students attended schools with relatively more students from economically disadvantaged homes, and these students had the lowest average achievement.

Successful schools also are likely to have better working conditions and facilities as well as more instructional materials, such as books, computers, technological support, and supplies. TIMSS 2011 created the Mathematics Resource Shortages scale based on principals' responses concerning inadequacies in general school resources (materials, supplies, heating/cooling/ lighting, buildings, space, and staff) as well as resources specifically targeted to support mathematics instruction (specialized teachers, computers, computer software, calculators, library materials, and audio-visual resources). Many countries were fortunate to have very few, if any, students in schools where instruction was Affected A Lot by resource shortages. However, this was a crucial problem in some countries. At both the fourth and eighth grades, the one-quarter of students in schools Not Affected by resource shortages had higher average mathematics achievement than their counterparts in less well-resourced schools. For students at the sixth and ninth grades, there was more impact from lack of resources, with greater percentages of students in schools Affected A Lot by resource shortages.

## Successful Schools Emphasize Academic Success and Have Safe and Orderly Environments

Students with the highest mathematics achievement typically attend schools that emphasize academic success, as indicated by rigorous curricular goals, effective teachers, students that desire to do well, and parental support. Both principals and teachers answered the questions comprising the School Emphasis on Academic Success scale, and both were extremely positive and remarkably similar in their responses. At both the fourth and eighth grades, there was a

direct correspondence between average mathematics achievement and principals' reports, with higher emphasis on academic success related to higher average mathematics achievement.

In contrast, schools with discipline and safety problems are not conducive to high achievement. The sense of security that comes from attending a school with few behavior problems and having little or no concern about student or teacher safety promotes a stable learning environment. To create the School Discipline and Safety scale, principals provided their perceptions about the degree to which a series of ten discipline, disorderly, and bullying behaviors were problems in their schools.

At both the fourth and eighth grades, students who attended schools with disorderly environments and who reported more frequent bullying had much lower achievement than their counterparts in safe and orderly schools. Interestingly, across the fourth grade countries, 61 percent of students, on average, attended schools with Hardly Any Problems with discipline or safety, 29 percent were in schools with Minor Problems, and 11 percent attended schools with Moderate Problems. Across the eighth grade countries, however, discipline appeared to be more of an issue; principals reported that only 16 percent of students were in schools with Hardly Any Problems, 66 percent were in schools with Minor

$\begin{array}{ll}\text { Principals' Problems with School Discipline } & \text { TIMSS } 2011 \\ \text { and Safety—International Averages } & 8^{\text {th }} \\ \text { Mathematics } & \text { Gade }\end{array}$ and Safety—International Averages
 Problems, and 18 percent attended schools with Moderate Problems.

There is growing evidence that bullying in schools is on the rise, especially with the emergence of cyber-bullying, and that bullying does have a negative impact on students' educational achievement. The Students Bullied at School scale was based on how often students experienced six bullying behaviors, such as "Someone spread lies about me" and "I was made to do things I didn't want to do by other students."

At both the fourth and eighth grades, an increase in the frequency of bullying was related to a decrease in average mathematics achievement. Unsettlingly, across countries, although nearly half of the fourth grade students reported Almost Never being bullied (48\%), the majority were bullied either About Monthly (32\%) or About Weekly (20\%).

In contrast to principals' reports of more school discipline and safety problems at the eighth grade than fourth grade, the eighth grade students reported experiencing somewhat less bullying behavior than the fourth grade students.

> Teacher Preparation and Career Satisfaction Related to Higher Mathematics Achievement

In view of the importance of a well-prepared teaching force to an effective education, TIMSS 2011 collected a variety of information about teacher education. Internationally, most students were taught by the following:

- Teachers with bachelor's or postgraduate university degrees ( $79 \%$ at the fourth grade, and $87 \%$ at the eighth grade);
- Teachers with at least 10 years of experience ( $71 \%$ at the fourth grade, and $64 \%$ at the eighth grade);
- Teachers who reported being Very Well prepared to teach the TIMSS mathematics topics ( $83 \%$ at the fourth grade, and $84 \%$ at the eighth grade); and
- Teachers Very Confident in teaching mathematics (75\% at the fourth grade, $76 \%$ at the eighth grade).

At both the fourth and eighth grades, students with more experienced and more confident teachers had higher mathematics achievement.

The TIMSS 2011 Teacher Career Satisfaction scale categorized students based on their teachers' degree of agreement with six statements, such as "I do important work as a teacher" and "I plan to continue as a teacher for as long as I can." At both the fourth and eighth grades, teacher satisfaction was positively related to average mathematics achievement, and very few students had teachers that expressed any dissatisfaction except in a small number of countries.

Internationally, the fourth grade students with Satisfied mathematics teachers (54\%) had higher achievement than those with teachers that were only Somewhat Satisfied (41\%) or Less Than Satisfied (5\%). The eighth grade mathematics teachers reported somewhat lower levels of career satisfaction, with the 47 percent of students taught by Satisfied mathematics teachers having higher mathematics achievement than those taught by only Somewhat Satisfied (45\%) or Less Than Satisfied (7\%) teachers.

## Students with Positive Attitudes Toward Mathematics Have Higher Achievement, but Attitudes Less Positive at the Eighth Grade

Each successive TIMSS assessment has shown a strong positive relationship within countries between student attitudes toward mathematics and their mathematics achievement. The relationship is bidirectional, with attitudes and achievement mutually influencing each other.

The Students Like Learning Mathematics scale was based on students' degree of agreement with six statements, such as "I enjoy learning mathematics" and "I learn many interesting things in mathematics." Internationally, nearly half of the fourth grade students

Like Learning Mathematics, and they had higher average achievement than those that Somewhat Like Learning Mathematics (36\%). Those that Do Not Like Learning Mathematics (16\%) had the lowest average achievement.

Students Confident in MathematicsInternational Averages
TIMSS $20118^{\text {th }}$

Substantially fewer eighth grade students reported positive attitudes toward learning mathematics. The eighth grade students with more positive attitudes had higher mathematics achievement, but only one-fourth were in the Like Learning Mathematics category and nearly one-third were in the category Do Not Like Learning Mathematics.

The Students Confident in Mathematics scale includes seven statements, such as "Mathematics is harder for me than for many of my classmates" (reverse coded) and "My teachers tells me I am good at mathematics." Internationally, just one-third of the fourth grade students expressed confidence in their mathematics ability, but their mathematics achievement was higher than for the Somewhat Confident students. The students lacking confidence (21\%) had the lowest achievement.

Disturbingly, only 14 percent of the eighth grade students, on average, expressed confidence in their mathematics ability, with most students divided between Somewhat Confident (45\%) and Not Confident (41\%). The achievement gap was more than 100 points between the small percentage of Confident students and the two-fifths Not Confident.

The Students Value Mathematics scale asked the eighth grade students about six different aspects of valuing mathematics, including "I think learning mathematics will help me in my daily life" and "I need to do well in mathematics to get the job I want." Apparently, even though many of

International Study Center
the eighth grade students do not especially enjoy learning mathematics, they do appreciate the value of the subject. Internationally, the nearly one-half of students that Value mathematics had the highest average achievement, followed by those that Somewhat Value the subject. Those that Do Not Value mathematics (15\%) had the lowest average achievement.

## Engaging Instruction Related to Higher Mathematics Achievement

To help build a better bridge between curriculum and instruction, TIMSS 2011 collected information about the concept of student engagement in learning, which focuses on the cognitive interaction between the student and the instructional content. To measure aspects of student engagement, TIMSS 2011 developed both a a student scale called the Engaged in Mathematics Lessons scale, and a teacher scale, called the Engaging Students in Learning scale.

From the students' perspective, the Engaged in Mathematics Lessons scale asked how much students agreed with five statements, such as "I know what my teacher expects me to do" and "I am interested in what my teacher says." Internationally, the fourth grade students Engaged in their mathematics lessons had the highest achievement, followed by those Somewhat Engaged (42\%) and the few students Not Engaged (8\%).

At the eighth grade, internationally, smaller percentages of students reported being Engaged, although this 25 percent had the highest mathematics achievement. The majority reported being only Somewhat Engaged, and the one-fifth of students Not Engaged had the lowest average achievement.

Also, students were categorized according to how often their teachers reported using six instructional practices (four at the eighth grade) intended to interest students and reinforce learning

(e.g., summarizing the lesson's learning goals, questioning to elicit reasons and explanations, and bringing interesting things to class). Many fourth grade students internationally (69\%) had mathematics teachers that made efforts to use these practices to engage them in Most Lessons, and the rest had teachers that used such practices in About Half the Lessons (with a few exceptions). Internationally, at the eighth grade, relatively small percentages of students had teachers that frequently related lessons to students' daily lives (39\%), and even smaller percentages had teachers that routinely brought interesting materials to class (18\%).

## Instruction Affected by Students Lacking in Basic Nutrition and Sleep

Finally, the characteristics of the students themselves can be very important to the classroom atmosphere. Unfortunately, some children in many countries around the world suffer from hunger, and a growing body of research, mostly in developing countries, is providing evidence that malnutrition has a negative impact on educational achievement. Similarly, a number of studies in a variety of countries have shown sleep duration and quality to be related to academic functioning at school.

On average, internationally, most fourth grade (71\%) and eighth grade students ( $63 \%$ ) were in classrooms where instruction was "not at all" limited because students were lacking in basic nutrition. These students had higher average mathematics achievement than their peers in classrooms where instruction was limited "some or a lot" because students suffered from lack of basic nutrition. The percentage lacking in basic nutrition was much higher in some countries, including some of those that participated at the sixth and ninth grades.

Internationally, students suffering from some amount of sleep deprivation did have lower average mathematics achievement. Teachers reported that only a scant majority of fourth grade students (53\%) and not even half of the eighth grade students (43\%), across countries, were in classrooms where instruction was "not at all" limited by students suffering from not enough sleep. Further, while there was considerable variation across countries, in a number of TIMSS 2011 countries and benchmarking participants at least two-thirds of students reportedly were at least somewhat sleep deprived.

## Introduction

Students need to develop mathematical understanding to manage successfully in school and society. Mathematics is the foundation for further study in a number of school subjects, most notably the sciences; and mathematics problem solving builds logical reasoning skills that can be applied in many situations. For students' everyday life, today and in the future, mathematics is pervasive, from managing money to cooking and a range of other tasks. For example, mathematics is used to determine lengths of time, put things together (from models to electronics), and calculate quantities of what to buy (from pizza to paint).

The world is becoming increasingly "quantified," and all students need to be well grounded in mathematical and technological thinking to live a productive life. To be effective future citizens, students need mathematics to understand daily news and grasp world events, often described through statistics, increases, and decreases. Considering students' future careers, mathematics is important to some degree in most occupations (e.g., construction, manufacturing, and business) and is required at a high level in many higher paying fields (e.g., engineers, scientists, accountants, and doctors).

TIMSS (Trends in International Mathematics and Science Study) has the goal of helping countries make informed decisions about how to improve teaching and learning in mathematics and
science. This TIMSS 2011 report summarizes the results of the TIMSS 2011 international mathematics assessment of fourth and eighth grade students in countries around the world. As the fifth assessment in a regular program of student assessment conducted every four years since 1995, TIMSS 2011 provides participating countries with a wealth of information about trends in the mathematics knowledge and skills of their students. At the heart of TIMSS is a wide-ranging state-of-the-art assessment of how well students master the essential mathematics content, concepts, and procedures that countries expect them to learn as they progress through primary and lower secondary school.

Student achievement on the TIMSS 2011 mathematics assessment is summarized in a variety of ways, beginning with trends over time in mathematics achievement overall as well as in its major component areas (e.g., algebra, geometry, etc.). The results also monitor progress toward the TIMSS International Benchmarks of mathematics achievement-advanced, high, intermediate, and low. Recognizing that student mathematics achievement is the result of a complex interplay of societal, school, and home environmental factors, this TIMSS mathematics report embeds the achievement results in the context of the major influences on student learning, including the scope and coverage of the mathematics curriculum, home support for student learning, school resources and learning climate, teacher preparation for mathematics instruction, and student engagement in classroom learning.

## Countries Participating in TIMSS 2011

TIMSS 2011 continues the series of mathematics and science assessments conducted by the International Association for the Evaluation of Educational Achievement (IEA). IEA is an independent international cooperative of national research institutions and government agencies with nearly 70 member countries worldwide. IEA has a permanent secretariat based in Amsterdam, and a thriving data processing and research center in Hamburg (the IEA DPC). The decision to participate in an IEA study is coordinated through the IEA Secretariat in Amsterdam and made solely by each member country according to its own data needs and resources.

Exhibit 1 shows the 63 countries participating in TIMSS 2011, including some distinct education systems within countries that have always participated separately throughout IEA's long history (e.g., the Dutch-speaking part of Belgium and Hong Kong SAR). In addition, TIMSS 2011 had 14 benchmarking participants, including three Canadian provinces, nine US states, and

two emirates from the United Arab Emirates. Countries and benchmarking participants could elect to participate in the fourth grade assessment, the eighth grade assessment, or both. Fifty-two countries and seven benchmarking participants administered the fourth grade assessment, and 45 countries and 14 benchmarking participants administered the eighth grade assessment.

Also, countries where students were expected to find the TIMSS assessments too difficult for their fourth or eighth grade students were given the option to assess students at a higher grade. Accordingly, three countries administered the fourth grade assessment to their sixth grade students and the eighth grade assessment to their ninth grade students.

In each country, nationally representative samples of approximately 4,000 students from 150-200 schools participated in TIMSS 2011 at each grade assessed. In total, more than 300,000 students participated in the TIMSS 2011 fourth grade assessment and a further 300,000 in the eighth grade assessment.

## The TIMSS Trend Assessments in Mathematics and Science

IEA pioneered international comparative assessments of educational achievement to gain a deeper understanding of the effects of policies and practices across countries' different systems of education. IEA began its pioneering work in the 1960's with an international study of mathematics achievement, and mathematics has remained a major focus throughout its 50 -year history of educational research. First administered in 1995, IEA's TIMSS is an integrated assessment of mathematics and science that has been conducted every four years since then. TIMSS is directed by IEA's TIMSS \& PIRLS International Study Center at Boston College.

With assessments in 1995, 1999, 2003, 2007, and 2011, TIMSS has measured international student achievement in mathematics and science over a 16-year period, providing an unrivalled data resource for trends in mathematics and science achievement. All of the countries, institutions, and agencies involved in successive TIMSS assessments have worked collaboratively in building the most comprehensive and innovative measures of mathematics and science achievement possible, beginning in 1995 and improving with each successive assessment. Appendix A shows the participation in earlier TIMSS assessments by each TIMSS 2011 participant.

With its strong curricular focus and emphasis on policy relevant information about the home, school, and classroom contexts, TIMSS is a valuable tool that countries can use to evaluate achievement goals and standards and monitor student achievement trends in an international context.

## New Policy-relevant Context Questionnaire Scales

TIMSS 2011 provides extensive information about home supports and school environments for teaching and learning. In particular, in 2011 the trend cycles of IEA's TIMSS and PIRLS international assessments came together producing a synergy that led to advancements in the quality of background data collected by both projects. Because PIRLS (Progress in International Reading Literacy Study) also assesses students at the fourth grade, the alignment of the two projects provided the opportunity for countries to assess the same fourth grade students in reading, mathematics, and science in conjunction with the extensive background data collected by IEA assessments-most notably, allowing TIMSS to benefit from the PIRLS Learning to Read Survey, completed by students' parents or caregivers.

Having almost 40 countries participate in both assessments required a great deal of coordination, innovation, and creativity, most notably in the area of background data collection. The TIMSS 2011 Student Questionnaires, Teacher Questionnaires, School Questionnaires, and Curriculum Questionnaires were developed jointly by TIMSS and PIRLS participants, including several joint meetings of the TIMSS 2011 Questionnaire Item Review Committee and the PIRLS 2011 Questionnaire Development Group. This effort yielded nearly 20 new context questionnaire scales about learning and teaching developed in parallel across reading, mathematics, and science. Underpinning a new approach to interpreting the questionnaire data, each context questionnaire scale was created using IRT methods, and results presented for three regions of the scale (most to least desirable) using scale score equivalents of response combinations to determine the cutpoints for the regions.

## The TIMSS 2011 Mathematics Assessment

The TIMSS 2011 mathematics assessment is based on a comprehensive framework developed collaboratively with the participating countries. As described in the mathematics chapter of the TIMSS 2011 Assessment Frameworks (Mullis, Martin, Ruddock, O'Sullivan, \& Preuschoff, 2009), at each grade the mathematics framework is organized around two dimensions: a content dimension specifying the domains or subject matter to be assessed within mathematics, and a cognitive dimension specifying the domains or thinking processes to be assessed. The content domains and the topic areas within the domains are described separately for the fourth and eighth grades, with each topic area elaborated with specific objectives.

There are three content domains for the TIMSS 2011 fourth grade assessment:

- Number;
- Geometric Shapes and Measures; and
- Data Display.

The eighth grade assessment has four content domains:

- Number;
- Algebra;
- Geometry; and
- Data and Chance.

The following three cognitive domains describe the sets of behaviors expected of students as they engage with the mathematics content:

- Knowing;
- Applying; and
- Reasoning.

These cognitive domains are the same for both grades, encompassing a range of cognitive processes involved in working mathematically and solving problems throughout the primary and middle school years.

Given the frameworks' broad coverage goals, the mathematics assessment item pools were necessarily large-175 and 217 assessment items at the fourth and eighth grades, respectively-with approximately half being multiple choice questions and half being in a constructed response format where students write their answers (see item counts by domain in Appendix B. 1 and B.2). To keep response burden to a minimum, each student participating in the assessment responded to just a subset of the item pool, with IRT scaling being used to estimate achievement on the assessment as a whole.

About 60 percent of the assessment items at each grade were retained from previous TIMSS assessments (2003 and 2007) to provide a foundation for measuring trends in mathematics achievement across assessments; the remaining 40 percent were developed for TIMSS 2011.

Developing the assessment materials for TIMSS 2011 was a cooperative venture, involving the National Research Coordinators (NRCs) from the participating countries throughout the entire process. Having reviewed their national mathematics curricula in the light of the TIMSS assessment approach,

NRCs met to update the assessment framework for 2011 in terms of the balance of content and cognitive domain coverage and the assessment topics to be included. To develop the assessment items needed for the field test, the TIMSS \& PIRLS International Study Center conducted an item-writing workshop for NRCs and their colleagues with particular backgrounds in mathematics assessment and item development. Participating countries field tested the items and scoring guides with representative samples of students, and the results were scrutinized internally by the TIMSS 2011 panel of internationally recognized experts-the Science and Mathematics Item Review Committee.

## Quality Assurance

The TIMSS mathematics assessments were given to carefully selected and welldocumented probability samples of students at the fourth and eighth grades. The student sampling for TIMSS 2011 was conducted with careful attention to quality and comparability. Staff from Statistics Canada and the IEA DPC worked with National Research Coordinators on all phases of the sampling activities. The Statistics Canada sampling experts, in conjunction with the TIMSS 2011 sampling referee (Keith Rust, Westat, Inc.), evaluated the quality of the samples and found high levels of compliance with sampling and participation requirements, with the exception of a few cases that are annotated in the report. Appendix C provides detail about the national target population coverage and sampling participation rates.

TIMSS 2011 made every effort to attend to the quality and comparability of the data through careful planning and documentation, cooperation among participating countries, standardized procedures, and rigorous attention to quality control throughout. For example, an extensive series of verification checks was conducted to ensure the comparability of the translations of the assessment items and questionnaires, detailed documentation was required to satisfy adherence to the sampling standards, and an ambitious quality assurance program was conducted to monitor the data collection.

## TIMSS 2011 Reports

The results from TIMSS 2011 are presented in a series of major reports.

- This present report, TIMSS 2011 International Results in Mathematics, summarizes fourth and eighth grade students' mathematics achievement in each of the 63 participating countries and 14 regional benchmarking jurisdictions, and describes the educational contexts for mathematics
instruction. It includes trends in mathematics achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003, and 2007 as well as student performance at the TIMSS International Benchmarks. Achievement results also are presented for mathematics content and cognitive domains. The Mathematics Report presents a rich array of information about students' backgrounds and attitudes toward mathematics, the mathematics curriculum, teachers' education and training, classroom characteristics and activities, and school contexts for mathematics learning and instruction.
- As a complement to this volume, the TIMSS 2011 International Results in Science (Martin, Mullis, Foy, \& Stanco, 2012) summarizes fourth and eighth grade students' science achievement in each of the 63 participating countries and 14 regional benchmarking jurisdictions, and describes the educational contexts for science instruction. It includes trends in science achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003, and 2007 as well as student performance at the TIMSS International Benchmarks. Achievement results also are presented for science content and cognitive domains. The Science Report presents a rich array of information about students' backgrounds and attitudes toward science, the science curriculum, teachers' education and training, classroom characteristics and activities, and school contexts for science learning and instruction.
- The TIMSS 2011 Encyclopedia: Education Policy and Curriculum in Mathematics and Science, Volumes 1 and 2 (Mullis, Martin, Minnich, Stanco, Arora, Centurino, \& Castle, 2012) describes national contexts for mathematics and science teaching and learning in the 63 countries and several of the regional benchmarking jurisdictions that participated in TIMSS 2011. A chapter prepared by each participant summarizes the structure of its education system, the mathematics and science curricula and instruction in primary and secondary grades, the teacher education requirements, and the types of examinations and assessments employed. Together with selected supporting data about the countries' curricula collected via online questionnaires, the chapters comprising the two volumes of the TIMSS 2011 Encyclopedia provide an important resource for helping to understand the teaching and learning of mathematics and science around the world, with particular emphasis on schooling through the eighth grade.
- The online publication, Methods and Procedures in TIMSS and PIRLS 2011 (Martin \& Mullis, 2012), describes the methods and
procedures used to develop, implement, and analyze the results from TIMSS 2011 and is available from the TIMSS \& PIRLS International Study Center's website: http://timssandpirls.bc.edu.

The fully documented TIMSS 2011 international database can be downloaded from the TIMSS \& PIRLS International Study Center's website.

In addition, special analyses are being conducted using the TIMSS and PIRLS database of fourth grade students. This report, TIMSS and PIRLS 2011: Relationships among Reading, Mathematics, and Science AchievementImplications for Early Learning, consists of in-depth analyses of fourth grade student achievement in reading, mathematics, and science in the countries that administered TIMSS and PIRLS to the same students in 2011. The report addresses four issues:

- Are primary schools providing a solid foundation in core subjectsreading, mathematics, and science?
- How does reading ability impact mathematics and science achievement?
- What are the characteristics of effective schools in reading, mathematics, and science? and
- How do homes support literacy and numeracy?

## International Student Achievement in Mathematics

East Asian countries continue to lead the world in mathematics achievement. Singapore, Korea, and Hong Kong SAR, followed by Chinese Taipei and Japan, were the top-performing countries in TIMSS 2011 at the fourth grade. Similarly, at the eighth grade, Korea, Singapore, and Chinese Taipei outperformed all countries, followed by Hong Kong SAR and Japan.

Since 1995, fourth grade students have shown more improvement than reduction in mathematics achievement ( 12 countries up vs. only 3 down), but improving eighth grade student achievement has been more difficult (9 up vs. 11 down).

Chapter 1 contains the mathematics achievement results for the 52 countries and seven benchmarking participants in the fourth grade TIMSS 2011 assessment and the 45 countries and 14 benchmarking participants in the eighth grade TIMSS 2011 assessment. To summarize mathematics achievement across the participants at fourth and eighth grades, the chapter provides:

- Averages (means) and distributions of mathematics achievement;
- Trends in mathematics achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003 and 2007;
- Trends across grades—relative achievement of 2007 fourth grade cohort as eighth grade students in 2011;
- Achievement differences by gender; and
- Trends in achievement differences by gender.

The results for percentages of students reaching the TIMSS International Benchmarks (Advanced, High, Intermediate, and Low) are presented in Chapter 2.

## Mathematics Achievement Across Countries

## TIMSS 2011 Mathematics Achievement

This section reports the TIMSS 2011 mathematics results as average scores and distributions on the fourth and eighth grade TIMSS scales, each of which has a range of $0-1,000$ (although student performance typically ranges between 300 and 700). The TIMSS mathematics achievement scales were established in TIMSS 1995 based on the achievement distribution across all participating countries, treating each country equally. At each grade level, the scale centerpoint of 500 was set to correspond to the mean of the overall achievement distribution, and 100 points on the scale was set to correspond to the standard deviation. Achievement data from subsequent TIMSS assessment cycles were linked to these scales so that increases or decreases in average achievement may be monitored across assessments. ${ }^{1}$ TIMSS uses the scale centerpoint as a point of reference that remains constant from assessment to assessment.

Exhibit 1.1 shows the distributions of student achievement for the participants in the TIMSS 2011 fourth grade assessment, including the average scale score with its 95 percent confidence interval and the ranges in performance for the middle half of the students ( $25^{\text {th }}$ to $75^{\text {th }}$ percentiles) as well as the extremes ( $5^{\text {th }}$ and $95^{\text {th }}$ percentiles). Similarly, Exhibit 1.2 shows the distribution
of mathematics achievement for participants in the TIMSS 2011 eighth grade assessment.

The first page of Exhibit 1.1 presents the results for the 50 countries that assessed students at the TIMSS target population of the fourth grade. In particular, the TIMSS target population for the fourth grade assessment is the grade that represents four years of schooling, counting from the first year of ISCED Level $1 . .^{2}$ Level 1 corresponds to primary education or the first stage of basic education, with the first year of Level 1 marking "systematic apprenticeship of reading, writing, and mathematics." However, IEA has a policy that children should be at least 9 years old before being asked to participate in a paper-andpencil assessment such as TIMSS. Thus, as a policy, TIMSS also tries to ensure that, at the time of testing, students do not fall under the minimum average age of 9.5 years old. So, England, Malta, and New Zealand, where students start school at a young age, were assessed in their fifth year of schooling, but still have among the youngest students and are reported together with the fourth grade countries. Exhibit C. 1 in Appendix C shows the grades and average ages of the students tested across countries, together with information about the policies and practices related to age of entry to primary school. The TIMSS 2011 Encyclopedia contains further details, such as countries' policies about promotion and retention.

The second page of Exhibit 1.1 shows the results for several countries that assessed their sixth grade students. To meet the needs of the increasing number of developing countries wanting to participate in TIMSS 2011, the TIMSS \& PIRLS International Study Center encouraged countries where the assessment was too difficult for fourth grade students to give the TIMSS fourth grade assessment at the sixth grade. Three countries elected to assess sixth grade students, including Botswana, Honduras, and Yemen (which also assessed its fourth grade students).

The second page of Exhibit 1.1 also presents the results for the TIMSS 2011 fourth grade benchmarking participants. The benchmarking participants followed the same procedures and met the same standards as the countries, the difference being that they are regional entities of countries. Benchmarking participants at the fourth grade included Florida and North Carolina (US states), Alberta, Ontario, and Québec (Canadian provinces), and Dubai and Abu Dhabi (emirates of the United Arab Emirates).

Following the same approach as Exhibit 1.1, the first page of Exhibit 1.2 presents the results for the 42 countries that assessed students at the TIMSS

[^0]target population of eighth grade, the grade that represents eight years of schooling. For the TIMSS eighth grade assessment, IEA has a policy that students should be at least 13 years old before being asked to participate. Thus, for this assessment, TIMSS tries to ensure that, at the time of testing, students do not fall under the minimum average age of 13.5 years old. So, England and New Zealand, where students start school at a young age, are reported together with the eighth grade countries. Exhibit C. 1 in Appendix C shows the grades and averages ages of students at the time of testing across countries, together with policies related to age of entry into school.

As with the fourth grade, the TIMSS \& PIRLS International Study Center encouraged countries where the TIMSS eighth grade assessment was too difficult for eighth grade students to instead assess students at a higher grade. The second page of Exhibit 1.2 shows the results for three countries that assessed their ninth grade students-Botswana, Honduras, and South Africa.

The second page of Exhibit 1.2 also presents the results for the TIMSS 2011 eighth grade benchmarking participants. Benchmarking participants at the eighth grade included nine US states (Alabama, California, Colorado, Connecticut, Florida, Indiana, Massachusetts, Minnesota, and North Carolina), three Canadian provinces (Alberta, Ontario, and Québec), and two emirates (Dubai and Abu Dhabi).

For each section of Exhibit 1.1 and in Exhibit 1.2, participants are shown in decreasing order of average achievement. Also, there is a symbol by a participant's average scale score indicating if the average achievement is significantly higher (up arrow) or lower (down arrow) than the scale centerpoint of 500 . TIMSS uses the centerpoint of the scale as a point of reference that remains constant from assessment to assessment. (In contrast, the international average, obtained by averaging across the mean scores for each of the participating countries, changes from assessment to assessment as the number and characteristics of the participating countries change.) Finally, several countries have annotations about 1) population coverage (detailed in Exhibit C.2); 2) sampling participation rates (explained in Exhibit C.8); and 3) the potential for bias in their achievement estimates (explained in the section after next).

## Achievement in TIMSS 2011 at the Fourth Grade

The results in Exhibit 1.1 (first page) show that many countries performed well in TIMSS 2011 at the fourth grade, with 24 countries having higher achievement

TIMSS \& PIRLS
than the scale centerpoint of 500 and several countries having average achievement above the High International Benchmark of 550. Because there are often relatively small differences between participants in average achievement, Exhibit 1.3 shows whether or not the differences in average achievement among the countries are statistically significant.

Singapore, Korea, and Hong Kong SAR were the top-performing countries in TIMSS 2011 at the fourth grade. Looking at the results in Exhibit 1.1 and taking into account the information in Exhibit 1.3, it can be seen that these three countries performed similarly and had higher achievement than all of the other countries. The next highest-performing country was Chinese Taipei, which had higher achievement than all countries except the three with the highest achievement, followed by Japan, which had average achievement higher than all countries except Chinese Taipei and the three top performers. Also included in the top ten high-achieving countries were Northern Ireland, Belgium (Flemish), Finland, England, and the Russian Federation. The benchmarking states of Florida and North Carolina had performance similar to these countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lowerperforming countries. Twenty-two countries had average achievement below the TIMSS centerpoint of 500 . For the most part, these countries had average achievement above the Low (400) International Benchmark.

## Very Low Performance on TIMSS 2011

It is a well-known principle of educational measurement that the difficulty of the items used to assess student achievement should match the ability of the students taking the assessment. In the context of assessing mathematics achievement, measurement is most efficient when there is a reasonable match between the mathematics ability level of the student population being assessed and the difficulty of the assessment items. The greater the mismatch, the more difficult it becomes to achieve reliable measurement. In particular, when the assessment tasks are much too challenging for most students, to the extent that many students are responding at chance level, it is extremely difficult to achieve acceptable measurement quality.

Monitoring trends over time is particularly problematic for a country with a high degree of mismatch between assessment difficulty and student achievement. If there are substantial numbers of students with very low scores, their achievement is likely to be overestimated and consequently the overall

Ж Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds $25 \%$.
$\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$.

Exhibit 1.2: Distribution of Mathematics Achievement (Continued)

Instructions: Read across the row for a country to compare performance with the countries listed along the top of the chart. The symbols indicate whether the average achievement of the country in the row is significantly lower than that of the comparison country, significantly higher than that of the comparison country, or if there is no statistically significant difference between the average achievement of the two countries.

achievement distribution becomes biased upwards. Educators and policy makers may work hard and make real strides in improving education from this assessment cycle to the next. However, because the achievement distribution at the earlier cycle was overestimated to begin with, the country would not see evidence of this improvement in the assessment results. The apparently poor return for all of the effort could be very disheartening to those who worked so hard and could prove a disincentive to further investment and effort.

Having substantial numbers of students with very low scores in a country also makes it difficult to estimate performance separately for the mathematics content and cognitive domains. The items comprising the mathematics reasoning scale were particularly difficult for such countries.

To identify countries where performance is deemed too low to provide reliable measurement of achievement and meaningful trend comparisons, the TIMSS \& PIRLS International Study Center conducted extensive investigations to detect when the quality of measurement erodes (Martin, Mullis, \& Foy, in press). The proportion of students unable to respond to any items on the assessment was selected as the best indicator of degree of mismatch between students' skills and those demanded by the assessment. Although the absolute lower limit would be no items answered correctly, about half the items were in multiple-choice format and guessing on these was possible. Thus, beginning in 2011, the criterion for having achievement too low for estimation was established based on the percentage of the students having a score no higher than what a student would achieve by guessing on all the multiple-choice questions-essentially the percentage of students performing below chance.

For each country, Appendix D shows the percentage of students with achievement too low for estimation (Exhibit D. 1 for the fourth grade and D. 2 for the eighth grade). When, as in Kuwait, Morocco, and Yemen at the fourth grade, the percentage of students with achievement too low for estimation exceeded 25 percent, the country was annotated with the symbol Ж. Achievement trends are not reported for these countries because of concerns about bias in the estimation of achievement for the student population. When, as in Oman and Tunisia, the percentage of students with achievement too low for estimation exceeded 15 percent but did not exceed 25 percent, the country was annotated with the symbol $\Psi$, indicating reservations about the reliability of the achievement estimates.

## Achievement in TIMSS 2011 at the Sixth Grade

As a group, the countries assessing their sixth grade students had average achievement between 348 and 419, falling at or below the Low International Benchmarks (400). This level of achievement is comparable to that of most of the lower-performing countries at the fourth grade. In addition, there was evidence of many very low-performing sixth grade students in Yemen (annotated with
 low for estimation exceeded 25\%) and to a lesser extent in Honduras (annotated with the symbol $\Psi$, indicating that the percentage of students with achievement too low for estimation exceeded $15 \%$ but did not exceed $25 \%$ ). Despite the low average achievement of the sixth grade students in Yemen, it is noteworthy that it exceeded the average achievement of Yemen's fourth grade students by 100 points.

## Achievement in TIMSS 2011 at the Eighth Grade

The results in Exhibit 1.2 (first page) show that Korea, Singapore, Chinese Taipei, Hong Kong SAR, and Japan, the five Asian countries with the highest average mathematics achievement at fourth grade, also have the highest achievement at eighth grade, with average achievement above the High International Benchmark of 550 in each case. In addition to these countries, the Russian Federation, Israel, Finland, the United States, and Slovenia had higher achievement than the scale centerpoint of 500 .

Looking at the results in Exhibit 1.2 and taking into account the information in Exhibit 1.4, which shows whether or not the differences in average achievement among the countries are statistically significant, it can be seen that Korea, Singapore, and Chinese Taipei performed similarly and had higher achievement than all of the other countries. The next highest-performing country was Hong Kong SAR, which had higher achievement than all countries except the three with the highest achievement, followed by Japan, which had average achievement higher than all countries except Hong Kong SAR and the three top performers. Also included in the top ten high-achieving countries were the Russian Federation, Israel, Finland, the United States, and England. Among benchmarking participants, the state of Massachusetts was outperformed only by the four highest achieving Asian countries, while the states of Minnesota and North Carolina and the Canadian province of Québec were outperformed only by the top five countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lowerperforming countries. Although ten countries had average achievement above the TIMSS centerpoint of 500 , twenty-seven countries had average achievement below this point, mostly falling above the Low (400) International Benchmark.

Similar to the fourth grade, a number of eighth grade participants had significant percentages of very low performing students, including Morocco and Ghana (percentage of students with achievement too low for estimation exceeded 25\%), and Macedonia, Iran, Qatar, Bahrain, Jordan, Palestinian National Authority, Saudi Arabia, Indonesia, the Syrian Arab Republic, and Oman (percentage of students with achievement too low for estimation exceeded $15 \%$ but did not exceed $25 \%$ ).

## Achievement in TIMSS 2011 at the Ninth Grade

As a group, the countries assessing their sixth grade students had average achievement between 338 and 397, below the Low (400) International Benchmark for eighth grade students. In addition, there was evidence of many very low performing ninth grade students in all three countries, with the percentage of students with achievement too low for estimation exceeding 25 percent in South Africa and Honduras and between 15 percent and 25 percent in Botswana.

## Trends in Mathematics Achievement

Exhibits 1.5 and 1.6 display changes in average mathematics achievement at fourth and eighth grades, respectively, for the countries and benchmarking participants that have comparable data from previous TIMSS assessments. For the fourth grade, there are 29 countries and four benchmarking participants having data from 1995, 2003, or 2007 that can be compared to $2011 .^{3}$ Twelve countries and two benchmarking participants have trend data from all four TIMSS fourth grade assessments. For the eighth grade (and Finland at the seventh grade), there are 34 countries and nine benchmarking participants having data from 1995, 1999, 2003, or 2007 that can be compared to 2011, including eleven countries and two benchmarking participants that have data from all five TIMSS eighth grade assessments. With the participants shown in alphabetical order, Exhibits 1.5 and 1.6 show average achievement for each assessment year, as well as achievement differences between years with an indication of statistical significance. The mathematics achievement distributions also are shown for each assessment year.

At the fourth grade, there are 17 countries and three benchmarking participants that have comparable data from 1995 and 2011 providing trends over the past 16 years. Exhibit 1.7 shows these countries ordered from most to least growth in achievement over this period, to focus on educational progress across the TIMSS assessment years and complement the complete detail in Exhibit 1.5. Exhibit 1.7 presents for the fourth grade a country-by-country graphical depiction of change in average mathematics achievement from 1995 to 2011, with growth curves aligned country-by-country to facilitate comparisons of change from assessment to assessment. That is, the same scale is used for each country (10-point intervals), but the part of the scale shown differs according to each country's average achievement. To complement Exhibit 1.6 and focus on long-term educational progress at the eighth grade, Exhibit 1.8 presents a similar depiction for the 25 countries and eight benchmarking participants that have comparable data at the eighth grade from the 1995 or 1999 and 2011 assessment years. It is particularly interesting to consider the TIMSS 2011 achievement results in light of the information countries provided in the TIMSS 2011 Encyclopedia. Many countries are engaged in implementing important structural, curricular, and instructional reforms and are using the TIMSS results across the assessment years to monitor the impact on achievement of these reforms. Looking at the trends in fourth grade mathematics achievement during the 1995-2011 period, there have been more countries with increases

[^2]Instructions: Read across the row to determine if the performance in the row year is significantly higher $(\boldsymbol{\otimes})$ or significantly lower $(\odot)$ than the performance in the column year.

$\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$. Such annotations in exhibits with trend data began in 2011, so data from assessments prior to 2011 are not annotated for reservations.
See Appendix C. 2 for target population coverage notes 1, 2, and 3. See Appendix C. 8 for sampling guidelines and sampling participation notes $\dagger$, $\ddagger$, and $\ddagger$.

* Tested the same cohort of students as other countries, but later in the assessment year at the beginning of the next school year.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

Instructions: Read across the row to determine if the performance in the row year is significantly higher ( $\mathbf{(})$ or significantly lower ( $\odot$ ) than the performance in the column year.

TIMSS \& PIRLS
than with decreases. Of the 17 countries and three benchmarking participants with data spanning this period (see Exhibit 1.7), twelve countries and one benchmarking participant had increases in average achievement, three countries and one benchmarking participant had decreases, and two countries and one benchmarking participant had no difference. Among the countries with the greatest increase from 1995 to 2011 were Portugal, England, Slovenia, Hong Kong SAR, and Iran, with average achievement increases of more than 40 points. Australia, Korea, and the United States increased more than 20 points, as did the province of Ontario.

At the eighth grade, there was more balance between mathematics achievement growth and decline among countries. Of the 25 countries and eight benchmarking participants with comparable data spanning the 1995 or 1999 to 2011 period, nine countries and four benchmarking participants had increased achievement, eleven countries and two benchmarking participants had decreased achievement, and five countries and two benchmarking participants showed no difference. The countries with the greatest increases in average mathematics achievement at the eighth grade included Korea, Lithuania, Chinese Taipei, and Chile (more than 20 points), as well as Italy, the United States, Hong Kong SAR, the Russian Federation, and Slovenia (10-20 points). Countries with the greatest decreases included Thailand, Sweden, and Malaysia (40 points or more), and Macedonia, Jordan, Hungary, Tunisia, and Norway (20-40 points). Also, Finland had a comparable decrease (38 points) for its seventh grade students. Among benchmarking participants, there were increases in Massachusetts ( 47 points), North Carolina ( 42 points), Minnesota ( 26 points), and Ontario (11 points). Alberta and Québec had decreased achievement over the period ( 22 and 25 points, respectively).

Instructions: Read across the row to determine if the performance in the row year is significantly higher ( $\boldsymbol{\Delta}$ ) or significantly lower ( $\boldsymbol{\nabla}$ ) than the performance in the column year.

[^3] annotations in exhibits with trend data began in 2011, so data from assessments prior to 2011 are not annotated for reservations.
Trend Notes: Trend results for Finland are based on 7th grade data from 1999 and 2011, and so Finland's 2011 results differ from Exhibit 1.1.
See Appendix C. 3 for target population coverage notes 1,2 , and 3 . See Appendix C. 9 for sampling guidelines and sampling participation notes $\dagger$, $\ddagger$, and $\ddagger$.

## Trends Across Grades: Fourth to Eighth Grade Cohort Analysis

Because TIMSS is conducted on a four-year cycle, the cohort of students that was assessed in the fourth grade in 2007 had reached the eighth grade by 2011, and thus was assessed at the eighth grade in 2011. This enables the 17 countries and three benchmarking participants that assessed both grades in both assessment years to examine how their performance relative to each other changed as the fourth grade students of 2007 became the eighth grade students of 2011. The results are presented in Exhibit 1.9, which shows average mathematics achievement as a difference from the TIMSS scale centerpoint (500) for the fourth grade students in 2007 (upper-left panel) and in 2011 (upper-right panel). The exhibit also shows achievement for the eighth grade students in 2007 (lower-left panel) and in 2011 (lower-right panel). The trends for the fourth and eighth grades (indicated by the gray horizontal arrows), however, were presented more fully in Exhibits 1.5 and 1.6, respectively. The purpose of Exhibit 1.9 is to provide information about relative progress across grades as the cohort of students assessed at the fourth grade in 2007 moved to the eighth grade four years later in 2011. That is, to compare relative performance at the fourth grade in 2007 (upper-left panel) to relative performance at the eighth grade in 2011 (lower-right panel) as indicated by the darker arrow pointing diagonally downward.

Six countries, including Hong Kong SAR, Singapore, Chinese Taipei, Japan, the Russian Federation, and the United States as well as the two Canadian provinces of Ontario and Québec performed above the scale centerpoint at the fourth grade in 2007 and again at the eighth grade in 2011 (although not in the same order of average achievement). Norway, Georgia, Iran, Tunisia and Dubai, UAE also retained the same relative positions, performing below the scale centerpoint in the fourth grade in 2007 and again at the eighth grade in 2011. However, six countries had a relative decline in achievement from fourth to eighth grades, with England, Lithuania, Australia, Hungary, and Italy

© Country average significantly higher than the centerpoint of the TIMSS scale
(7) Country average significantly lower than the centerpoint of the TIMSS scale

[^4]moving from above the centerpoint at the fourth grade in 2007 to close to the centerpoint at the eighth grade in 2011, and Sweden moving from near the centerpoint to below the centerpoint in 2011. In comparison, Slovenia was the only country to show relative improvement, moving from about the centerpoint at the fourth grade in 2007 to just above it at the eighth grade in 2011.

## Gender Differences in Mathematics Achievement

Previous TIMSS assessments have shown gender differences in mathematics achievement to be small on average at the fourth grade and somewhat larger in favor of girls at the eighth grade, although the situation varies considerably from country to country.

Exhibit 1.10 presents the TIMSS 2011 fourth grade results for gender differences in mathematics achievement. For the TIMSS 2011 countries at fourth grade, at sixth grade, and the benchmarking participants, it shows girls' average achievement, boys' average achievement, and the difference between the two averages. The bar graph shows the size of the achievement difference and whether that difference is statistically significant (as indicated by a darkened bar). For countries participating at the fourth grade, international averages also are shown (averages across the mean scores for girls in each of the countries and the mean scores for boys in each of the countries). Exhibit 1.11 presents corresponding results for the TIMSS 2011 eighth grade assessment.

In each section of Exhibit 1.10, participants are shown in order by the increasing size of the difference between girls and boys in average mathematics achievement. Averaging mathematics achievement across countries, it is clear that there was little achievement difference between girls and boys (International Average: 490 vs. 491 ). Of the 50 countries at the fourth grade, 26 had no significant gender difference in mathematics achievement. Of the 24 remaining countries, 20 had small differences favoring boys, and four had relatively larger differences favoring girls (Qatar, Thailand, Oman, and Kuwait). At the sixth grade, there was a significant achievement difference favoring girls in Botswana and favoring boys in Honduras. Boys also had higher average mathematics achievement than girls in each of the benchmarking entities, except Dubai where there was no difference and Abu Dhabi where girls had higher achievement than boys.

As shown in Exhibit 1.11, gender differences in mathematics achievement at the eighth grade were larger, on average, than at fourth grade, with the difference favoring girls (International Average: 469 vs. 465). Similar to the

fourth grade, the gender difference varied across countries, with no difference in 22 of the 42 eighth grade countries, a difference favoring boys in seven countries, and a difference favoring girls in the remaining 13 countries. For Botswana and Honduras, which assessed their ninth grade students, gender differences resembled their sixth grade results, with girls having higher mathematics achievement than boys in Botswana and boys higher than girls in Honduras. There were no gender differences among the eighth grade benchmarking participants, with the exception of the state of Indiana, where boys performed better than girls by a small margin.

At both fourth and eighth grades, and consistent with findings from TIMSS 2007, the largest achievement differences favoring girls were often in Arabic-speaking countries from the Middle East, including Qatar, Oman, Kuwait, and Abu Dhabi, UAE at fourth grade and the United Arab Emirates, Palestinian National Authority, Jordan, Bahrain, and Oman at eighth grade.

## Trends in Mathematics Achievement by Gender

Exhibits 1.12 and 1.13 show graphic representations across the TIMSS assessments of trends in mathematics achievement of boys and girls for fourth and eighth grades, respectively. For each country that participated in one or more of the previous TIMSS assessments, these displays show how trends in mathematics achievement have been influenced by differential performance by boys and girls. Because there are many different patterns across countries, the countries are presented in alphabetical order. The scale interval is the same for each country (10 points) to permit comparisons, although the part of scale shown differs according to each country's average achievement. For countries with gender differences in mathematics achievement, the displays reveal progress (or lack thereof) over time toward gender equity.

As described in the previous section, at the fourth grade there is already gender equity in mathematics achievement in many countries, but there are also countries where overall achievement is less than it might be if both boys and girls performed at the same high level. Countries where fourth grade girls performed consistently below boys (i.e., in 2011 and on at least two other TIMSS assessments) include Austria, the Czech Republic, Italy, the Netherlands, Slovenia, the United States, and the Canadian province of Québec. In Germany, Korea, and the Slovak Republic, boys had higher average achievement than girls on each of the two TIMSS assessments in which they participated. Armenia, Sweden, and Tunisia had gender differences in earlier assessments but not in TIMSS 2011.

With greater gender differences among countries, and trends across five TIMSS assessments, trends at the eighth grade in mathematics achievement for boys and girls follow a variety of paths. A number of countries show an increasing difference across the years, including Bahrain, Indonesia, Jordan, Lithuania, Malaysia, New Zealand, Oman, and Romania. However, there were few instances of countries decreasing an existing gender gap in mathematics achievement.

## Chapter 2

## Performance at the TIMSS 2011 International Benchmarks

The five East Asian countries had the largest percentages of fourth grade students (30-43\%) reach the TIMSS 2011 Advanced International Benchmark. Building on this head start, these five countries pulled away from the rest of the world by a considerable margin at the eighth grade, with by far the largest percentages of students reaching this benchmark-nearly half (47-49\%) in Chinese Taipei, Singapore, and Korea.

Remarkably, nine countries raised achievement across their entire fourth grade student distribution, from low to high performers, improving across all four international benchmarks over the past decade; only one declined across all four benchmarks. At the eighth grade, only three countries showed improvement across all benchmarks, and three had declines.

TIMSS Mathematics Benchmarks:

Advanced International Benchmark 625
High International
Benchmark 550
Intermediate International Benchmark 475
Low International Benchmark 400

The TIMSS achievement scale summarizes student performance on test items designed to measure breadth of content in number, algebra, geometry, and data as well as a range of cognitive processes within the knowing, applying, and reasoning domains. TIMSS reports achievement at four points along the scale as international benchmarks: Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400).

This chapter presents the mathematics results at the TIMSS 2011 International Benchmarks. To interpret achievement at the benchmarks, the TIMSS \& PIRLS International Study Center worked with the TIMSS 2011 Science and Mathematics Item Review Committee (SMIRC) to conduct a detailed scale anchoring analysis to describe mathematics achievement at the benchmarks. The chapter contains those descriptions along with a number of example items together with results, to illustrate performance at the benchmarks.

## TIMSS 2011 Mathematics Framework

The items used in TIMSS 2011 were selected and developed based on the TIMSS 2011 Mathematics Framework contained in the TIMSS 2011 Assessment Frameworks. The mathematics assessments at the fourth and eighth grade each were organized around two dimensions: a content dimension specifying the subject matter or content domains to be assessed, and a cognitive dimension specifying the thinking processes that students are likely to use as they engage with the content. As illustrated below, the fourth grade has three content domains: number, geometric shapes and measures, and data display. Number received 50 percent of the assessment emphasis, geometric shapes and measures 35 percent, and data display 15 percent. At the eighth grade, there are four content domains: number, algebra, geometry, and data and chance. Number and algebra each received 30 percent of the assessment emphasis, while geometry and data and chance each received 20 percent. The same three cognitive domains-knowing, applying, and reasoning-were used at both fourth and eighth grades, although there was somewhat less emphasis on knowing at the eighth grade and slightly more emphasis on reasoning.

## Advanced International Benchmark

Students can apply their understanding and knowledge in a variety of relatively complex situations and explain their reasoning. They can solve a variety of multi-step word problems involving whole numbers, including proportions. Students at this level show an increasing understanding of fractions and decimals. Students can apply geometric knowledge of a range of two- and three-dimensional shapes in a variety of situations. They can draw a conclusion from data in a table and justify their conclusion.

## ○ High International Benchmark

Students can apply their knowledge and understanding to solve problems. Students can solve word problems involving operations with whole numbers. They can use division in a variety of problem situations. They can use their understanding of place value to solve problems. Students can extend patterns to find a later specified term. Students demonstrate understanding of line symmetry and geometric properties. Students can interpret and use data in tables and graphs to solve problems. They can use information in pictographs and tally charts to complete bar graphs.

## Intermediate International Benchmark

Students can apply basic mathematical knowledge in straightforward situations. Students at this level demonstrate an understanding of whole numbers and some understanding of fractions. Students can visualize three-dimensional shapes from two-dimensional representations. They can interpret bar graphs, pictographs, and tables to solve simple problems.

## ○ Low International Benchmark

400 Students have some basic mathematical knowledge. Students can add and subtract whole numbers. They have some recognition of parallel and perpendicular lines, familiar geometric shapes, and coordinate maps. They can read and complete simple bar graphs and tables.

## Fourth Grade Results for the TIMSS 2011 International Benchmarks in Mathematics

## Fourth Grade TIMSS 2011 International

 Benchmarks of Mathematics AchievementExhibit 2.1 summarizes what fourth grade students scoring at the TIMSS International Benchmarks typically know and can do in mathematics. Detailed descriptions of each benchmark level are presented together with example items in subsequent sections of the chapter.

There was substantial variation in performance between students achieving at the high end of the scale and the low end of the scale. At the fourth grade, students at the Advanced International Benchmark applied their understanding and knowledge in a variety of relatively complex situations and were able to explain their reasoning. They could solve a variety of multi-step word problems, and showed an increasing understanding of fractions and decimals. Also, they applied geometric knowledge in a range of situations and could draw a conclusion from a table. Students at the High International Benchmark could solve word problems involving operations with whole numbers, and were able to interpret and use data in tables and graphs to solve problems. At the Intermediate International Benchmark students demonstrated an understanding of whole numbers, they could visualize three-dimensional shapes from two-dimensional representations, and they could interpret a variety of graphs. Students at the Low International Benchmark were able to add and subtract whole numbers, recognize some geometric shapes, and read simple graphs and tables.

Fourth Grade Achievement at the TIMSS 2011 International Benchmarks of Mathematics Achievement
Exhibit 2.2 presents the percentage of students reaching each TIMSS 2011 International Benchmark. The results are presented in descending order according to the percentage of students reaching the Advanced International Benchmark, first for countries that tested fourth grade students, followed by those who tested sixth grade students and benchmarking participants on the second page. The percentage of students reaching the Advanced Benchmark is indicated in the bar graph with a black dot. Because students who reached the Advanced Benchmark also reached the other benchmarks, the percentages illustrated in the graphic and shown in the columns to the right are cumulative.

The five East Asian countries had the largest percentages of students reaching the Advanced International Benchmark. Singapore had 43 percent of their students reach the Advanced International Benchmark, followed by

Korea (39\%), Hong Kong SAR (37\%), Chinese Taipei (34\%), and Japan (30\%). Northern Ireland was next with 24 percent, then England, 18 percent, followed by a group of eight countries with 10 to 13 percent.

Exhibit 2.2 also provides useful information about the distribution of achievement in each country. For example, even though the Netherlands had fewer students (5\%) reaching the advanced level than did the top-performing Asian countries, it had just as many fourth grade students reaching the low level (99\%).

As a point of reference, Exhibit 2.2 provides the median at the fourth grade for each of the benchmarks at the bottom of each of the four right hand columns. By definition, half of the countries will have a percentage in the column above the median and half will be below the median. The median percentages of students reaching the International Benchmarks were as follows: Advanced-4 percent, High-28 percent, and Intermediate-69 percent. Many countries are able to educate almost all of their fourth grade students to a basic level of mathematics achievement, as evidenced by a median percentage for the Low International Benchmark of 90 percent.

## Fourth Grade Trends in Performance at the TIMSS 2011 International Benchmarks of Mathematics Achievement

Exhibit 2.3 shows the changes in percentages of fourth grade students reaching the benchmarks for countries and benchmarking participants that also participated in TIMSS 1995, 2003, and/or 2007. An up arrow indicates that the percentage of students reaching a benchmark is higher in 2011 than the past cycle, and a down arrow indicates that the percentage is lower in 2011. The patterns in this exhibit generally mirror the trends in average achievement discussed in Chapter 1, and can provide further information about countries' improvement or decline over time.

In general, there were more improvements across the International Benchmarks in 2011 than there were declines. Remarkably, a number of countries have improved since 1995 at all four benchmarks, including Korea (with a ceiling effect at the Low Benchmark), Hong Kong SAR, Japan, England, the United States, Australia, Portugal, Slovenia, and Iran. Singapore and Norway had gains at all except the Advanced Benchmark, and New Zealand improved at the two lower levels.

The Czech Republic was the only country to show declines at all four levels since 1995, although it showed signs of recovery with improvement at all four levels since 2007. Austria declined at all except the low level, and the Netherlands declined at the two top levels.

## Fourth Grade TIMSS 2011 Low International Benchmark

Exhibit 2.4 presents the description of student achievement at the Low International Benchmark. Students demonstrated some basic mathematical knowledge, including adding and subtracting with whole numbers. They recognized familiar geometric shapes, and could read and complete simple bar graphs and tables.

As specified in the TIMSS 2011 Mathematics Framework, half of the fourth grade assessment was devoted to items in the number domain. More specifically, the framework covered whole numbers, fractions and decimals, number sentences, and patterns. Working with whole numbers is the foundation of mathematics in the primary school; and often, items answered correctly by students achieving at the lower scale levels involved operations with whole numbers and decimals.

Exhibit 2.5 presents Example Item 1, an addition word problem exemplifying student achievement at the Low International Benchmark. In TIMSS 2011, some of the constructed response items were worth 1 point and some 2 points, and the illustrative answers provided with the example items always show an answer that received full credit. The number of possible points for each constructed-response item is indicated across the bottom of the exhibit. With an international average of 73 percent correct across the fourth grade countries, this whole number addition item was relatively easy for students in many countries.

Exhibit 2.6 contains Example Item 2 from the data display domain. By the fourth grade, students should be developing skills in representing data, and this item is an example of the types of problems successfully solved by students reaching the Low Benchmark. The item asked students to complete a bar graph based on given information. Again, the international average was 73 percent, and this task was relatively easy for students in a number of countries

# Exhibit 2.4: Description of the TIMSS 2011 Low International Benchmark (400) of Mathematics Achievement 

## Low International Benchmark

## Summary

Students have some basic mathematical knowledge. Students can add and subtract whole numbers. They have some recognition of parallel and perpendicular lines, familiar geometric shapes, and coordinate maps. They can read and complete simple bar graphs and tables.

Students at this level can add and subtract whole numbers. For example, they can add a four-digit and a three-digit whole number. They are familiar with numbers into the thousands.
Students have some recognition of parallel and perpendicular lines and familiar geometric shapes. They can locate positions on a map (e.g., A3). Students can read and complete simple bar graphs and tables.

Fourth Grade TIMSS 2011 Intermediate International Benchmark
Exhibit 2.7 provides the description of student achievement at the Intermediate International Benchmark. Most countries had the majority of their students reaching this benchmark. Students at this level demonstrated an understanding of whole numbers, as well as some understanding of one-place decimals, proportion, geometric patterns, symmetry, and movement on a grid. They can match data in pie charts and tables to bar graphs.

Example Item 3 in Exhibit 2.8 is a word problem involving addition of oneplace decimals. The average percent correct was 60 percent, with a considerable range in performance. In Korea and Japan, 95-97 percent of students answered correctly, compared to 19 percent in Yemen and Kuwait.

Exhibit 2.9 presents Example Item 4 from the domain of geometric figures. It asks students to visualize a three-dimensional shape made of cubes. On average, internationally, 63 percent of the fourth grade students answered correctly. Across the fourth grade, sixth grade, and benchmarking participants, in most cases the majority of students could do this task.

Exhibit 2.10 presents Example 5 from the data display domain, asking students to choose which graph presents the same information as shown in the pie chart. The international average was 71 percent correct, and it is clear from the country-by-country results that this material is covered in most but not all countries. In general, most students did relatively well across the fourth grade, sixth grade, and benchmarking participants.

Exhibit 2.7: Description of the TIMSS 2011 Intermediate International Benchmark (475)

## Intermediate International Benchmark

Summary
Students can apply basic mathematical knowledge in straightforward situations. Students at this level demonstrate an understanding of whole numbers and some understanding of fractions. Students can visualize three-dimensional shapes from two-dimensional representations. They can interpret bar graphs, pictographs, and tables to solve simple problems.

Students at this level demonstrate an understanding of whole numbers. For example, they can identify the value of a digit in a four-digit number and solve problems involving multiplication of one-digit numbers. Students can add one-place decimals and can identify an expression that represents a situation involving addition or subtraction. They can identify representations of unit and non-unit fractions and solve simple proportional problems involving halving. They can extend simple geometric patterns to determine the next terms.
Students can visualize three-dimensional shapes from two-dimensional representations including recognizing some properties of familiar solids. They can order a set of angles by size. They can recognize a line of symmetry and draw the reflection of a simple shape. They can identify the movement on a grid necessary to get from one position to another.
Students can interpret information in bar graphs, pictographs, and tables to solve simple problems. They can read and interpret different representations of the same data. For example, they can match data in pie charts and tables to bar graphs.

## Fourth Grade TIMSS 2011 High International Benchmark

Exhibit 2.11 presents the description of achievement at the High International Benchmark. The length of the description signals that students reaching this level demonstrated some competency with many of the topics in the framework. For example, their skills in number included solving problems involving twodigit numbers, division, and proportional reasoning. They could solve a variety of problems involving symmetry. In addition, they could interpret and use data in tables and graphs to solve problems.

Example Item 6 shown in Exhibit 2.12 illustrates the growing facility in the number domain demonstrated by students at the High Benchmark. This is a word problem set in a real life context and involving measurementsspecifically, the addition of time. This word problem was solved correctly by 52 percent of the students internationally, on average.

Exhibit 2.13 presents Example Item 7, a constructed response item from the geometric shapes domain assessing understanding of symmetry. Students were given three sides of the shape on the grid and asked to finish drawing the shape according to the specifications. Internationally, on average, 42 percent of the students successfully completed a five-sided symmetrical shape. The top performance was in Hong Kong SAR, where 84 percent of the students could do this problem; but the next highest achievement was in Korea with two-thirds answering successfully.

Example Item 8 shown in Exhibit 2.14 is an example of a data display problem likely to be answered correctly by students reaching the High Benchmark. Because students needed to read the problem and the graph, and devise a strategy for using the information in the graph to answer the question, this item was classified as multi-step reasoning problem. Internationally, on average, 54 percent of the students answered correctly.

## ○ High International Benchmark

## Summary

Students can apply their knowledge and understanding to solve problems. Students can solve word problems involving operations with whole numbers. They can use division in a variety of problem situations. They can use their understanding of place value to solve problems. Students can extend patterns to find a later specified term. Students demonstrate understanding of line symmetry and geometric properties. Students can interpret and use data in tables and graphs to solve problems. They can use information in pictographs and tally charts to complete bar graphs.

Students at this level can solve word problems involving operations with whole numbers. They can multiply two-digit numbers and use division in a variety of problem situations. They can use their understanding of place value to solve problems. For example, they can identify the missing digit in a number given its place value, the sum closest to a given value, and appropriately rounded numbers. They show some understanding of multiples and factors.
Students can read unlabelled gradations on a scale and solve a word problem involving measures and proportional reasoning. They can solve word problems involving addition of time. They can add two-place decimals and order unit fractions. They can write a number between two consecutive whole numbers. Students can extend patterns to find a later specified term and use two-step rules to continue a pattern.
Students demonstrate understanding of line symmetry. For example, they can draw lines of symmetry, reflect shapes across a line of symmetry and identify symmetrical shapes. They can classify shapes according to given properties. They can recognize right angles, parallel, and perpendicular lines in different orientations. They can find perimeters of simple figures. They can recognize a net of a cube and the stack of cubes with largest volume.
Students can interpret and use data in tables and graphs to solve problems. For example, they can compare data from two sources to draw conclusions. They can use information in pictographs and tally charts to complete bar graphs.

Fourth Grade TIMSS 2011 Advanced International Benchmark
Exhibit 2.15 describes fourth grade performance at the Advanced International Benchmark. Students reaching this level demonstrated facility with many of the topics in the TIMSS 2011 Mathematics Framework. They typically demonstrated success on the knowledge and skills represented by this benchmark, as well as those demonstrated at the High, Intermediate, and Low Benchmarks. They could solve a variety of multi-step word problems involving whole numbers and demonstrated an increasing understanding of fractions and decimals. Students could apply geometric knowledge about a range of shapes and solve problems involving area and perimeter. Finally, they could explain their reasoning, and organize, interpret, and represent data to solve two-step problems.

Example Item 9 in Exhibit 2.16 shows an example of the types of items students at the Advanced International Benchmark could answer correctly. This constructed-response multi-step numerical reasoning problem was answered successfully by 27 percent of the students internationally, on average. It is interesting to note that the five top-performing East Asian countries had the highest achievement on this reasoning item, with approximately half of their students able to provide the correct answer.

Example Item 10 in Exhibit 2.17 shows a constructed-response item in a somewhat different format. To demonstrate their understanding of various geometric properties, students needed to answer the series of questions correctly. They needed to be able to visualize the two solids and apply their understanding of geometric terms such as square, face, and right angle. Internationally, on average, only one-third of the fourth grade students were able to do so.

## Eighth Grade Results for the TIMSS International Benchmarks in Mathematics

Eighth Grade Achievement at the TIMSS 2011 International Benchmarks of Mathematics Achievement
Exhibit 2.18 provides an overview of eighth grade achievement at the TIMSS 2011 International Benchmarks. The next sections of the chapter contain detailed descriptions of each level accompanied with example items. The top and bottom of the scale differentiates between those advanced eighth grade students who have a solid foundation across the TIMSS mathematics topics including algebra, compared to those at the low end with mathematics understanding in closer alignment to the TIMSS fourth grade topics.

Students at the Advanced International Benchmark can reason with information and make generalizations. In number, they can solve a variety of fraction, percent, and proportion problems, and in algebra they can solve problems involving equations, formulas, and functions. They also can reason with geometric figures and data from several sources to solve multi-step problems. In contrast, students at the Low International Benchmark have some knowledge of whole number and decimals, operations, and basic graphs.

## Eighth Grade Achievement at the TIMSS 2011 International Benchmarks of Mathematics Achievement

Exhibit 2.19 presents the percentage of students reaching each TIMSS 2011 International Benchmark. The results are presented in descending order according to the percentage of students reaching the Advanced International Benchmark, first for countries that tested eighth-grade students, and then for ninth-grade students and benchmarking participants on the following page. The percentage of students reaching the Advanced Benchmark is indicated in the bar graph with a black dot. Because students who reached the Advanced Benchmark also reached the other benchmarks, the percentages shown in the graphic and in the data columns to the right are cumulative.

At the eighth grade, clearly the East Asian countries, particularly, Chinese Taipei, Singapore, and Korea, are pulling away from the rest of the world in mathematics achievement by a considerable margin.

Capitalizing on the head start demonstrated by their fourth grade students, the five East Asian countries had the largest percentages of eighth grade students reaching the Advanced International Benchmark. Very impressively, Chinese Taipei, Singapore, and Korea had nearly half their students (47-49\%) reach

## - Advanced International Benchmark

Students can reason with information, draw conclusions, make generalizations, and solve linear equations. Students can solve a variety of fraction, proportion, and percent problems and justify their conclusions. Students can express generalizations algebraically and model situations. They can solve a variety of problems involving equations, formulas, and functions. Students can reason with geometric figures to solve problems. Students can reason with data from several sources or unfamiliar representations to solve multi-step problems.

## ○ High International Benchmark

Students can apply their understanding and knowledge in a variety of relatively complex situations. Students can use information from several sources to solve problems involving different types of numbers and operations. Students can relate fractions, decimals, and percents to each other. Students at this level show basic procedural knowledge related to algebraic expressions. They can use properties of lines, angles, triangles, rectangles, and rectangular prisms to solve problems. They can analyze data in a variety of graphs.

## - Intermediate International Benchmark

Students can apply basic mathematical knowledge in a variety of situations. Students can solve problems involving decimals, fractions, proportions, and percentages. They understand simple algebraic relationships. Students can relate a two-dimensional drawing to a three-dimensional object. They can read, interpret, and construct graphs and tables. They recognize basic notions of likelihood.

## Low International Benchmark

Students have some knowledge of whole numbers and decimals, operations, and basic graphs.

## Exhibit 2.19: Performance at the International Benchmarks of Mathematics Achievement

TIMSS 2011 $8^{\text {th }}$
Mathematics Grade

※ Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds $25 \%$.
$\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation is less than $25 \%$ but exceeds $15 \%$. See Appendix C. 3 for target population coverage notes 1,2 , and 3 . See Appendix C. 9 for sampling guidelines and sampling participation notes $\dagger, \ddagger$, and $\ddagger$.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

| 12 California, US | - 0 |  | 5 (0.9) | 24 (2.5) | 59 (2.8) | 87 (1.7) |
| ${ }^{2}$ Ontario, Canada | - 0 | - | 4 (0.6) | 31 (1.4) | 71 (1.4) | 94 (0.7) |
| ${ }^{2}$ Alberta, Canada | 0 | - | 3 (0.5) | 24 (1.3) | 69 (1.6) | 95 (0.7) |
| ${ }^{1}$ Alabama, US | - 0 | - | 2 (0.8) | 15 (2.5) | 46 (3.1) | 79 (2.2) |
| Abu Dhabi, UAE | - 0 |  | 2 (0.5) | 12 (1.2) | 39 (1.8) | 71 (1.5) |

the Advanced International Benchmark. Hong Kong SAR had about one-third of students (34\%) reach the Advanced Benchmark and Japan had about onefourth (27\%). Next, the Russian Federation and Israel had 12 to 14 percent, and the remaining countries all had less than 10 percent of their students reaching the Advanced Benchmark. Several of the US benchmarking states did have from 10-19 percent of students reaching the Advanced Benchmark, including Massachusetts, North Carolina, Minnesota, and Connecticut.

Exhibit 2.19 also provides useful information about the distribution of achievement in each country. For example, some countries such as Turkey are doing relatively better at the top end of the distribution, with 7 percent reaching the Advanced Benchmark, although only 67 percent reached the Low Benchmark. In comparison, Slovenia, Finland, and Italy had only 3 to 4 percent reaching the Advanced Benchmark but nearly all students (at least 90\%) reaching the low level.

As a point of reference, Exhibit 2.19 provides the median at the eighth grade for each of the benchmarks at the bottom of each of the four right hand columns. By definition, half of the countries will have a percentage in the column above the median and half will be below the median. The median percentages of students reaching the International Benchmarks were as follows: Advanced-3 percent, High-17 percent, Intermediate-46 percent, and Low-75 percent. In comparison, at the fourth grade, the median percentage for the Low International Benchmark was 90 percent. Compared to fourth grade, more eighth grade students were being "left behind" their classmates. That is, except in the top-five countries and several other countries (the Russian Federation, the United States, Slovenia, Lithuania, Finland, and Italy), more than 10 percent of the students did not reach the Low Benchmark, which is characterized as similar to the TIMSS fourth grade topics.

TIMSS \& PIRLS

## Eighth Grade Trends in Performance at the TIMSS 2011 International

 Benchmarks of Mathematics AchievementExhibit 2.20 shows the changes in percentages of eighth grade students reaching the benchmarks for countries and benchmarking participants that also participated in TIMSS 1995, 1999, 2003, and/or 2007. An up arrow indicates that the percentage of students reaching a benchmark is higher in 2011 than the past cycle, and a down arrow indicates that the percentage is lower in 2011. The patterns in this exhibit generally mirror the trends in average achievement discussed in Chapter 1, and can provide further information about countries' improvement or decline over time.

Three countries improved since 1995 at all four benchmarks, including Korea, the United States, and Lithuania. The Russian Federation and Iran had gains at the two highest levels and Slovenia improved at the two lower levels. A number of other countries have shown improvements since 2007 at all four levels, including Singapore, the Russian Federation, Ukraine, Georgia, Bahrain, and the Palestinian National Authority. Tunisia improved at the three top levels between 2007 and 2011, and also Italy improved at three levels (all except advanced). There were also three countries that declined since 1995 at all four benchmarks: Hungary, Sweden, and Norway. Singapore and Japan declined at all except the Advanced Benchmark and Romania and New Zealand at the two lower benchmarks. Some countries had recent declines since 2007, including Jordan at all four levels, Sweden at all except the low level, Malaysia at all except the advanced level, and Thailand and Indonesia at the two middle levels.

(7) 2011 percent significantly lower
$\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$. Such annotations in exhibits with trend data began in 2011, so data from assessments prior to 2011 are not annotated for reservations.
An empty cell indicates a country did not participate in that year's assessment.
Trend Notes: Trend results for Finland are based on 7th grade data from 1999 and 2011, and so Finland's 2011 results differ from Exhibit 2.19.

## Eighth Grade TIMSS 2011 Low International Benchmark

Exhibit 2.21 presents the description of student achievement at the Low International Benchmark. Students have an elementary understanding of whole numbers and decimals and can do basic computations. They can match tables to bar graphs and pictographs and read a simple line graph.

Exhibit 2.22 presents Example Item 1, which involved adding a twoplace and three-place decimal. This item, exemplifying performance at the low level, was answered correctly by 72 percent of the eighth grade students, internationally, on average. More than 80 percent of the students answered correctly in many countries.

Example Item 2, shown in Exhibit 2.23, illustrates another type of item students at the low level could answer correctly. One of the algebra topics in the TIMSS 2011 Mathematics Framework at the eighth grade is algebraic expressions, and this item asks students to evaluate a simple algebraic expression. Similar to the results for Example Item 1, internationally, on average, 71 percent of the eighth grade students answered correctly. Also, more than 80 percent of the students answered this substitution item correctly in almost one-third of the countries.

Low International Benchmark

[^16]Exhibit 2.24 provides the description of student achievement at the Intermediate International Benchmark. Students at this level can solve problems involving decimals, fractions, proportions, and percentages. They know the meaning of simple algebraic expressions and can relate a two-dimensional drawing to a three-dimensional object. They can locate and interpret data presented in various tabular and graphic formats, and have some understanding of the likelihood of an event.

As mentioned in discussing performance at the low level (Example Item 2), algebraic expressions was a topic in the TIMSS Framework. Example Item 3 shown in Exhibit 2.25 is a slightly more difficult item assessing this topic. This item asks students to identify the meaning of a simple algebraic expression, therefore they need to understand the symbolic representation.

Exhibit 2.26 presents Example Item 4 from the domain of geometric figures. One geometry topic is recognizing relationships between three-dimensional and two-dimensional shapes, and this item asked students to recognize a pyramid from its net and then draw it directly from above. On average, internationally, 58 percent of the eighth grade students answered correctly. Clearly, such visualization tasks are more widely taught in some countries than others.

## Intermediate International Benchmark

## 475 summary

Students can apply basic mathematical knowledge in a variety of situations. Students can solve problems involving decimals, fractions, proportions, and percentages. They understand simple algebraic relationships. Students can relate a two-dimensional drawing to a three-dimensional object. They can read, interpret, and construct graphs and tables. They recognize basic notions of likelihood.

Students can solve problems involving decimals, fractions, proportions, and percentages in a variety of settings. For example, they can determine proportions of a whole in order to construct pie charts and calculate unit prices to solve a problem.
Students at this level know the meaning of simple algebraic expressions. For example, they can identify an algebraic expression that represents a situation. They can extend number patterns to the next few terms.
Students can relate a two-dimensional drawing to a three-dimensional object and solve a simple problem involving angles.
Students can locate and interpret data presented in tables, bar graphs, pie charts, and line graphs. For example, they can use information in a table to complete a bar graph. They can compare data from two line graphs to solve a problem. They have some understanding of the likelihood of an event and can determine the chances of outcomes of simple events.

Description: Given a net of a three-dimensional object, completes a twodimensional drawing of it from a specific viewpoint

The shape shown above is cut out of cardboard. The triangle flaps are then folded up along the dotted lines until they touch the edges of the flaps next to them.

Complete the diagram below to show what the shape would look like when viewed from directly above.

The answer shown illustrates the type of student response that was given 1 of 1 points.

## Eighth Grade TIMSS 2011 High International Benchmark

Exhibit 2.27 presents the description of achievement at the High International Benchmark. Eighth grade students at this level could apply their mathematical knowledge and understanding in a variety of relatively complex situations. For example, they could relate fractions, decimals, and percents to each other. They showed procedural knowledge related to algebraic expressions and could identify the quantity that satisfies two inequalities. They could use properties of lines, angles, and triangles to solve problems. Students also could analyze data from pie charts, line graphs, and bar graphs to solve problems and provide explanations, as well as solve simple problems involving outcomes and probabilities.

Example Item 5, shown in Exhibit 2.28, illustrates the growing facility demonstrated by students at the High Benchmark in converting between percents and fractions. This constructed response item was successfully completed by 37 percent of students, internationally, on average. Singapore was by far the top-performer, with 89 percent correct.

Exhibit 2.29 presents Example Item 6, showing a problem situation involving inequalities represented by balances that can readily be solved using algebra. Nearly four-fifths of the Korean students answered this item correctly. The country-by-country results indicate that students in the East Asian countries are familiar with algebra by the eighth grade, as are students in Finland and the Russian Federation. However, in about a dozen countries, only about one-third or fewer of the students answered this problem correctly. Internationally, on average, 47 percent of the eighth grade students answered correctly.

Example Item 7, shown in Exhibit 2.30, is an example of a data display problem likely to be answered correctly by students reaching the High Benchmark. Students needed to compute the correct proportions from the data in the table, and then construct and label their own pie chart. Internationally, on average, 47 percent of the students answered correctly.

TIMSS \& PIRLS

## ○ High International Benchmark

## Summary

Students can apply their understanding and knowledge in a variety of relatively complex situations. Students can use information from several sources to solve problems involving different types of numbers and operations. Students can relate fractions, decimals, and percents to each other. Students at this level show basic procedural knowledge related to algebraic expressions. They can use properties of lines, angles, triangles, rectangles, and rectangular prisms to solve problems. They can analyze data in a variety of graphs.

Students can use information from several sources to solve problems involving different types of numbers and operations. Students can relate fractions, decimals, and percents to each other. They can solve problems with fractions, proportions, and percentages. Students show understanding of whole number exponents. They can identify the prime factorization of a given number.
Students at this level show basic procedural knowledge related to algebraic expressions. They can evaluate a variety of expressions and formulas. They can simplify an algebraic expression by combining like terms and identify equivalent expressions. They can identify algebraic expressions that correspond to simple situations and add algebraic expressions. Students can identify the solutions of linear equations and a pair of simultaneous linear equations, and identify the quantity that satisfies two inequalities.
Students can use properties of lines, angles, and triangles to solve problems. They can find the perimeter of a square given its area or vice-versa. They can solve problems involving rectangular prisms. Students can produce a drawing that meets given angle specifications. They can recognize rotations and reflections, visualize a figure cut from a folded piece of paper, and draw the missing half of a symmetrical figure. Students can solve simple problems involving outcomes and probabilities. They can calculate means and determine medians. They can analyze data from pie charts, line graphs, and bar graphs to solve problems and provide explanations.

## Eighth Grade TIMSS 2011 Advanced International Benchmark

Exhibit 2.31 describes eighth grade performance at the Advanced International Benchmark. Students reaching this level were adept at many of the topics in the TIMSS 2011 Mathematics Framework. They could reason with a variety of different types of numbers (whole numbers, negative numbers, fractions, and percentages) in routine and non-routine situations and justify their conclusions. They could express generalization algebraically and solve a variety of problems involving equations, formulas, and functions. They could reason with geometric figures to solve problems and reason with data from several sources to solve multi-step problems.

Example Item 8 in Exhibit 2.32 shows an example of the types of items students at the Advanced International Benchmark could answer correctly. It illustrates how students could reason with fractions in an abstract, non-routine situation. They were given two points on a number line representing unspecified fractions, and asked to identify the point that represented their product. Even in the multiple-choice format, only 23 percent of the eighth grade students internationally answered correctly, on average.

Exhibit 2.33 contains Example Item 9, which involves geometric measurement. Specifically, this is a constructed-response item asking students how many books of a given size will fit in a box of a given size. Once again, approximately 60 percent of students or more in the five top-performing East Asian countries could solve this problem. The next highest achievement, however, was 36 percent in the Russian Federation; and in many countries, very few students could solve this problem.

Example Item 10 in Exhibit 2.34 asks students to solve a linear inequality. This was beyond many students in most countries, except in Korea and Chinese Taipei, where 60 and 52 percent, respectively, successfully solved the problem. Forty to 47 percent of students in Armenia, the Russian Federation, Singapore, Israel, and Lebanon also solved this item correctly, though internationally, on average, only 17 percent of the eighth grade students were able to do so.

## - Advanced International Benchmark

## Summary

Students can reason with information, draw conclusions, make generalizations, and solve linear equations. Students can solve a variety of fraction, proportion, and percent problems and justify their conclusions. Students can express generalizations algebraically and model situations. They can solve a variety of problems involving equations, formulas, and functions. Students can reason with geometric figures to solve problems. Students can reason with data from several sources or unfamiliar representations to solve multi-step problems.

Students can solve a variety of fraction, proportion, and percent problems and justify their conclusions. They can reason with different types of numbers, including whole numbers, negative numbers, fractions, and percentages in abstract and non-routine situations. For example, given two points on a number line representing unspecified fractions, students can identify the point that represents their product.
Students can express generalizations either algebraically or in words. For example, they can express the $n$th term in number patterns. They can write algebraic expressions that model situations in word problems and geometric figures. They can add three simple algebraic expressions with different numerical denominators, subtract expressions, and identify the sum of three consecutive whole numbers given the middle number represented algebraically.
They can solve a variety of problems involving equations, formulas, and functions. For example, they can solve a linear inequality involving fractions, solve linear equations with negative terms, and solve a pair of simultaneous linear equations. They can write an equation to model a situation and solve it. They can identify the linear equation that is satisfied by two ordered pairs or shown graphically. They demonstrate an understanding of slope.
Students can reason with geometric figures to solve problems involving parallel lines, similar triangles, the sum of angles in a triangle, and interior and exterior angles. They also can use their knowledge of geometric figures to solve a wide range of problems about area and volume. For example, they can find the area of a trapezoid inscribed in a rectangle and solve a multi-step word problem involving ratios between volumes. They can use the Pythagorean theorem to find the area of a triangle and the perimeter of a trapezoid. Students can solve distance problems about points on a line or on a coordinate grid.
Students can reason with data from several sources or unfamiliar representations to solve multi-step problems. They demonstrate understanding of the meaning of averages. Students can extrapolate data from a graph and explain why a data representation can be misleading.

## Chapter 3

## International Student Achievement in the TIMSS Mathematics Content and Cognitive Domains

Generally, TIMSS 2011 participants with the highest achievement overall also had the highest achievement in the mathematics content domains (e.g., number and algebra). Internationally, the fewest countries showed relative strength in geometry. Also, more countries demonstrated relative strengths in knowing mathematics than in applying and reasoning.

As described in the TIMSS 2011 Assessment Frameworks, the mathematics assessment is organized around two dimensions: a content dimension specifying the subject matter or content domains to be assessed in mathematics, and a cognitive dimension specifying the thinking processes that students are likely to use as they engage with the content. Each item in the mathematics assessment is associated with one content domain and one cognitive domain, providing for both content-based and cognitive-oriented perspectives on student achievement in mathematics.

There are three content domains at the fourth grade: number, geometric shapes and measures, and data display; and there are four domains at the eighth grade: number, algebra, geometry, and data and chance. The same three cognitive domains-knowing, applying, and reasoning-were used at both the fourth and eighth grades. Knowing refers to the student's knowledge base of mathematics facts, concepts, tools, and procedures. Applying focuses on the student's ability to apply knowledge and conceptual understanding in a problem situation. Reasoning goes beyond the solution of routine problems to encompass unfamiliar situations, complex contexts, and multi-step problems.

Chapter 3 presents the TIMSS 2011 results at the fourth and eighth grades for the content and cognitive domains. Previous TIMSS assessments have found that most countries performed relatively better in one or other of the content domains; and similarly, that countries can have relative strengths in one cognitive domain compared to another. In addition to providing TIMSS 2011 average achievement for the content and cognitive domains, the chapter provides changes in achievement in the domains compared to TIMSS 2007, and achievement differences by gender.

## Relative Achievement by Mathematics Content Domains

Exhibit 3.1 presents the average achievement for TIMSS 2011 participants in the fourth grade content domains of number, geometric shapes and measures, and data display relative to overall fourth grade mathematics achievement. To provide a way for the TIMSS 2011 participants to examine relative performance in the content domains, IRT scaling was used to place achievement in each of the three domains on the TIMSS fourth grade mathematics scale. The items on which the content domains were based varied in difficulty, as shown in Appendix E, which contains the average percent correct across the items on each domain. For example, the fourth grade students found the number and geometric shapes and measures items ( $47 \%$ and $49 \%$ correct, on average)
somewhat more difficult than the data display items (58\%). There was also some variation in the difficulty of the eighth grade content domains, with algebra most difficult ( $37 \%$ correct, on average), followed by geometry (39\%), number (43\%), and data and chance (45\%). However, the scaling process took the differences in difficulty into account, so that average achievement for each of the content domains can be compared relative to overall mathematics achievement at each grade level.

In Exhibit 3.1, the first column presents average overall mathematics achievement for each participant in the TIMSS 2011 fourth grade assessment, followed by average achievement in the three content domains of number, geometric shapes and measures, and data display. The participants are presented in order by overall mathematics achievement, first for the fourth grade followed by the sixth grade, and the benchmarking participants. The average scale score for each content domain is shown, together with the difference between achievement in overall mathematics and achievement in the content domain. Up and down arrows are used to indicate whether a country's average content domain score is significantly higher or lower than its overall mathematics average score.

Generally, the TIMSS 2011 participants with the highest achievement overall also had the highest achievement in the content domains. However, many countries performed relatively higher in one or two of the content domains compared to their overall performance; and relatively lower in one or two others. For example, among the top-performing countries, Singapore performed relatively better in number than in mathematics overall, and relatively less well in geometric shapes and measures and data display, while Korea performed equally well in all three domains. Hong Kong SAR and Chinese Taipei also performed relatively better in number than in mathematics overall, but Hong Kong performed relatively better in geometric shapes and measures and less well in data display while Chinese Taipei did relatively better in data display and less well in geometric shapes and measures. Looking across the results in Exhibit 3.1, there is considerable diversity among countries with relative strengths and weaknesses in the content domains. It is noteworthy that countries with lower average mathematics achievement tended to perform relatively better in number than in mathematics overall, and relatively less well in geometric shapes and measures.

Exhibit 3.2 presents average achievement in the eighth grade content domains of number, algebra, geometry, and data and chance. Similar to the

International Study Cente
fourth grade, there is considerable diversity in countries' strengths and weaknesses in the content domains, even among the high-achieving Asian countries. For example, although the differences were small, Korea performed somewhat better in number, algebra, and data and chance than in mathematics overall, whereas Singapore performed better in algebra and less well in data and chance. Chinese Taipei had more pronounced achievement differences among the content domains, with achievement in algebra and geometry well above overall mathematics achievement, and number and data and chance well below (although still very high in comparison to most other countries). Hong Kong SAR and Japan present other configurations of relative strength, with Hong Kong performing relatively better in number and geometry and less well in algebra and data and chance, and Japan performing less well in number but better in geometry and data and chance than in mathematics overall. Looking across the countries participating at the eighth grade, many (25) had relatively higher achievement in algebra than they did overall, and fewer (only 10) had relatively higher achievement in geometry. At the ninth grade and among the benchmarking participants, there were some different patterns, in particular, with nine US states generally reflecting overall achievement in the United States. Nearly all of the ninth grade and Benchmarking participants had a relative weakness in geometry, but many showed relative strengths in number as well as data and chance.

## Relative Achievement by Mathematics Cognitive Domains

Exhibits 3.3 and 3.4 present average achievement at the fourth and eighth grades, respectively, in the cognitive domains of knowing, applying, and reasoning relative to overall mathematics achievement for TIMSS 2011 participants. Because these three scales represent quite different skills, it was expected that the assessment items would have different difficulty levels. The average percent correct in the cognitive domains shown in Appendix E were 55 percent for knowing, 50 percent for applying, and 40 percent for reasoning at the fourth grade, and 49 percent, 39 percent, and 30 percent, respectively, at the eighth grade. However, as with the content domains, the IRT scaling adjusts for these difficulty levels in placing achievement in the three cognitive domains on the overall mathematics scales for the fourth and eighth grades, and allows each TIMSS 2011 participant to compare performance in the cognitive domains relative to overall mathematics achievement.

[^30](7) Subscale score significantly lower than overall mathematics score

The presentation of results for the cognitive domains in Exhibits 3.3 and 3.4 follows the layout of results in the content domains (Exhibits 3.1 and 3.2). Similar to the results for the content domains, generally, the TIMSS 2011 participants with the highest mathematics achievement overall also had highest achievement in the cognitive domains, although most countries showed a relative strength in one cognitive domain or another. At the fourth grade, the highest achieving countries and benchmarking participants performed relatively better in the knowing domain than overall and, with some exceptions, relatively less well in applying and reasoning. In general, more participants in the fourth grade assessment had relatively higher achievement in knowing (than lower achievement in this domain) compared to mathematics overall, and nearly half performed less well in applying compared to only few performing better in applying than overall. Participants were equally divided between performing relatively better and relatively less well in the reasoning domain.

At the eighth grade, the highest achieving countries showed a variety of relative strengths in the cognitive domains, with Korea and Chinese Taipei performing relatively better in applying, Singapore performing relatively better in knowing and applying and less well in reasoning, Hong Kong SAR doing better in knowing and less well in reasoning, and Japan doing less well in knowing and relatively better in applying and reasoning. Across the countries participating at the eighth and ninth grades, approximately the same number performed relatively higher in knowing than in mathematics overall as performed relatively lower. However, compared to mathematics overall, fewer performed relatively higher in applying and reasoning than performed lower.

## Trends in Achievement in Mathematics Content Domains

Exhibits 3.5 and 3.6 show changes from 2007 to 2011 in average achievement in the mathematics content domains for fourth and eighth grade students, respectively. Countries are shown in alphabetical order, followed by the benchmarking participants.

Many of the TIMSS 2011 fourth grade participants that also participated in 2007 and have comparable data showed an increase in mathematics achievement over this four-year period. Referring back to Exhibit 1.5, it can be seen that 10 countries (Chinese Taipei, the Czech Republic, Denmark, Georgia, Iran, Japan, Norway, Slovenia, Tunisia, and the United States) and 2 benchmarking participants (Québec and Dubai) had higher average mathematics achievement in 2011 than in 2007, and no participant had lower
achievement. Exhibit 3.5 shows that in six of the countries with an increaseChinese Taipei, the Czech Republic, Iran, Norway, Slovenia, and Tunisia-and in both benchmarking participants, the overall increase was due to increased achievement in all three mathematics content domains. However, there were also countries where the overall mathematics increase was due primarily to increases in particular domains. In Denmark, the 2007-2011 increase was due to improved performance in number, whereas in Georgia it was due to improved performance in geometric shapes and measures and data display. The increases in overall mathematics achievement in Japan and the United States resulted from improvements in number and geometric shapes and measures.

Although not showing overall increases in mathematics achievement between 2007 and 2011, Austria and the Netherlands had improved performance in data display; Germany and Hungary in geometric shapes and measures and data display; Lithuania in geometric shapes and measures; and the Slovak Republic in number and data display. Australia had a decrease in data display, and New Zealand decreases in geometric shapes and measures and data display. Alberta province had increased achievement in number, but lower achievement in geometric shapes and measures and data display.

Of the TIMSS 2011 eighth grade participants that also participated in 2007 and have comparable data, there were both participants with increases and participants with decreases in average mathematics achievement over the period. From Exhibit 1.6 it can be seen that nine countries (Bahrain, Chinese Taipei, Georgia, Italy, Korea, Palestine, the Russian Federation, Singapore, and the Ukraine) and Dubai, UAE had higher average mathematics achievement in 2011 than in 2007, and six countries (Hungary, Jordan, Malaysia, Sweden, Syria, and Thailand) had lower achievement. Exhibit 3.6 shows that in four of the countries with an overall increase-Italy, Palestine, the Russian Federation, and the Ukraine-the increase was due to improved performance in all four mathematics content domains. In Chinese Taipei, the increase was due to improvements in number and geometry; in Bahrain, Georgia, and Dubai due to improved number, algebra, and data and chance; in Korea due to improved number, geometry, and data and chance; and in Singapore due to improved algebra, geometry, and data and chance. Among the countries with an overall decrease in mathematics achievement, only Jordan and Malaysia had decreases in all four content domains. Syria had declines in number, geometry, and data and chance. Of the others, the decline in Hungary was due mainly to a drop in algebra performance; in Sweden

© 2011 average significantly higher
( $) 2011$ average significantly lower
due to lower geometry and data and chance achievement; and in Thailand due to a decrease in number and geometry achievement.

Although not showing an overall increase in eighth grade mathematics achievement between 2007 and 2011, a number of participants had improved performance in one or more content domains, including Australia (algebra), Hong Kong SAR (geometry, data and chance), Iran (number, algebra, geometry), Norway (number, algebra, data and chance), Slovenia (data and chance), Tunisia (number), Massachusetts (geometry), and Minnesota (number, algebra). Several participants also had lower achievement in one or more content domains in 2011 without having lower overall mathematics achievement, including England (geometry), Indonesia (number), Japan (data and chance), Lithuania (geometry, data and chance), Oman (data and chance), and Ontario (data and chance).

## Trends in Achievement in Mathematics Cognitive Domains

Exhibits 3.7 and 3.8 show changes from 2007 to 2011 in average achievement in the mathematics cognitive domains for fourth and eighth grade students, respectively. As with the content domains, overall increases or decreases in mathematics achievement since 2007 were reflected in increases or decreases in the cognitive domains. As shown in Exhibit 3.7, the overall increase in mathematics achievement was due to increases in all three cognitive domains in the Czech Republic, Denmark, Iran, Japan, Norway, Slovenia, and Tunisia as well as Québec and Dubai. In Chinese Taipei and the United States, the overall increase was due mainly to increases in the knowing and applying domains, whereas in Georgia it was the result of improvement in the applying and reasoning domains. Although not showing an overall increase in fourth grade mathematics achievement between 2007 and 2011, a number of countries had improved performance in one or more cognitive domains, including Germany, the Netherlands, and Ontario province (knowing), Lithuania (reasoning), and the Slovak Republic (knowing, reasoning). New Zealand, while not having lower overall mathematics achievement, performed less well in reasoning in 2011 than in 2007.

Exhibit 3.8 shows that for six of the nine countries with higher average mathematics achievement in 2011 than in 2007 (Georgia, Italy, Palestine, the Russian Federation, Singapore, and the Ukraine) and for Dubai, the increase was due to improved performance in all three mathematics cognitive domains. Whereas for Bahrain, the increase was mainly due to improved performance in knowing and reasoning; for Chinese Taipei, improved performance in applying; and, for Korea, improved performance in applying and reasoning.

Among the six countries with an overall decrease, Jordan and Malaysia had lower achievement in all three cognitive domains. Of the others, Hungary had lower achievement in knowing and reasoning, Sweden in reasoning, and Syria as well as Thailand in applying and reasoning.

Countries without an overall increase in eighth grade mathematics achievement between 2007 and 2011 but with improved performance in one or another cognitive domains included Australia, Hong Kong SAR, Iran, Norway, Slovenia, Tunisia, and the state of Minnesota. Indonesia and Japan had lower achievement in the knowing domain in 2011 than in 2007, and Oman in the reasoning domain.

## Achievement in the Mathematics Content and Cognitive Domains by Gender

Exhibits 3.9 and 3.10 present the TIMSS 2011 gender differences in average achievement for the content domains at the fourth and eighth grades. At the fourth grade, boys had higher achievement in number than girls in 22 countries and five benchmarking entities, compared to only four countries where girls outperformed boys. Boys had higher achievement in geometric shapes and measures than girls in nine countries and two benchmarking entities, compared with eight countries and one benchmarking entity where girls outperformed boys. In data display, girls had higher achievement than boys in eleven countries and one benchmarking entity, compared to just four countries where boys had higher achievement. On average across the fourth grade countries, boys had a 3-point advantage in number whereas girls had a 2-point advantage in geometric shapes and measures and a 4-point advantage in data display. At the sixth grade, girls in Botswana performed better than boys in all three content domains, and in Honduras, boys performed better in number than girls.

As shown in Exhibit 3.10, on average across the eighth grade countries, boys had higher achievement than girls in number ( 468 vs. 464 ) but girls had higher achievement in algebra (476 vs. 464), geometry (464 vs. 461), and data and chance ( 459 vs. 456 ). Boys outperformed girls in number in 18 countries and nine benchmarking entities, while girls outperformed boys in algebra in 22 countries and five benchmarking entities, in geometry in nine countries and one benchmarking entity, and in data and chance in one country.

Exhibits 3.11 and 3.12 present gender differences in the cognitive domains for the fourth and eighth grades. On average across the fourth grade countries, boys had higher achievement than girls in the reasoning domain. However, across the eighth grade countries, girls outperformed boys on average in both the knowing and reasoning domains.

- Average significantly higher than other gender
* Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds $25 \%$.
$\Psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$.
See Appendix C. 3 for target population coverage notes 1, 2, and 3. See Appendix C. 9 for sampling guidelines and sampling participation notes $\dagger$, $\ddagger$, and $\ddagger$.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

## Home Environment Support for Mathematics Achievement

The importance of an early start in school was related to higher mathematics achievement in TIMSS 2011. Fourth grade students had higher mathematics achievement if their parents reported that they often engaged in early numeracy activities with their children, that their children attended preschool, and that they started school able to do early numeracy tasks (e.g., simple addition and subtraction). Home resources for learning and high expectation were related to higher average achievement at the fourth and eighth grades.

Considerable research supports the fundamental importance of a supportive home environment in shaping children's achievement in school. Internationally, IEA studies in mathematics through four cycles of TIMSS have found a strong positive relationship between students' mathematics achievement at the fourth and eighth grades and home environments that foster learning.

This chapter presents the fourth grade TIMSS 2011 mathematics achievement results in relation to parents' reports about their children's home resources for learning and early numeracy experiences. The parents' data were collected using the TIMSS \& PIRLS 2011 Learning to Read Survey, in which students' parents or primary caregivers were asked to provide information about their child's early literacy and numeracy experiences, and so are available only for countries that administered both TIMSS and PIRLS to the same fourth grade students. For the eighth grade, mathematics achievement is presented in relation to students' own reports of aspects of their home environments.

## Home Resources for Learning

The TIMSS \& PIRLS 2011 Learning to Read Survey asked students' parents to report on the availability of three key home resources highly related to student achievement in school:

- Parents' education;
- Parents' occupation; and
- Number of children's books in the home.

In addition, students were asked about:

- Number of books in the home; and
- Availability of two study supports-An Internet connection and their own room.

Research consistently shows a strong positive relationship between achievement and socioeconomic status (SES), or indicators of socioeconomic status such as parents' or caregivers' level of education or occupation. TIMSS, PIRLS, and PISA have found strong positive relationships between level of parents' education and/or occupation and their children's educational attainment. In general, higher levels of education can lead to careers in higher paying professions, higher socioeconomic status, and more home resources. Family income also has been shown to have a powerful influence on students' achievement in reading and mathematics (Dahl \& Lochner, 2005). However, the benefits of higher levels of parents' education can extend to having more positive

TIMSS \& PIRLS
beliefs and higher expectations toward educational achievement transfer to their children. Availability of reading material in the home likewise is strongly related to achievement in mathematics and science as well as in reading. IEA's TIMSS studies have consistently shown that students with a large number of books in the home have higher achievement in mathematics and science.

Exhibit 4.1 presents the results for the TIMSS 2011 Home Resources for Learning scale, which was created based on parents' and students' reports about the five types of home resources described above. Results are shown for countries that administered both TIMSS and PIRLS fourth grade assessments to the same fourth grade students. The second page of the exhibit provides detail about the questions forming the scale and the categorization of responses. Students were scored according to the availability of the five home resources, with Many Resources corresponding to more than 100 books in the home, having both their own room and an Internet connection, more than 25 children's books, at least one parent having completed university, and one with a professional occupation, on average. Few Resources corresponds, on average, to having 25 or fewer books, neither of the home study supports, 10 or fewer children's books, neither parent having gone beyond upper secondary school, and neither having a business, clerical, or professional occupation.

Countries are ordered by the percentage of students in the Many Resources category, with the fourth grade countries on the first page of the exhibit and the sixth grade and benchmarking participants on the second page. Internationally, on average, almost three-quarters of the fourth grade students (74\%) were assigned to the Some Resources category. Seventeen percent, on average, were in the Many Resources category and nine percent internationally were in the Few Resources category, with a 119-point difference in their average mathematics achievement ( 555 vs. 436 ). Students in the countries participating at the sixth grade had relatively fewer home resources, comparable to the fourthgrade countries with the lowest levels.

Exhibit 4.2 provides supporting detail about the availability of the specific home resources included in the Home Resources for Learning scale for the fourth grade assessment. The exhibit presents data on two components (More than 100 Books in Their Home as well as both Own Room and Internet Connection in Home) for all participants in the fourth grade TIMSS assessment, as well as data on three additional resources for countries that participated in both TIMSS and PIRLS with the same students. On average, across all of the countries participating in TIMSS 2011 at the fourth grade, one-fourth of the

## Exhibit 4.1: Home Resources for Learning*

Reported by Parents, except Number of Books and Study Supports Reported by Students
Students were scored according to their own and their parents' responses concerning the availability of five resources on the Home Resources for Learning scale. Students with Many Resources had a score of at least 11.9, which is the point on the scale corresponding to students reporting they had more than 100 books in the home and two home study supports, and parents reporting that they had more than 25 children's books in the home, that at least one parent had finished university, and that at least one parent had a professional occupation, on average. Students with Few Resources had a score no higher than 7.3 , which is the scale point corresponding to students reporting that they had 25 or fewer books in the home and neither of the two home study supports, and parents reporting that they had 10 or fewer children's books in the home, that neither parent had gone beyond upper-secondary education, and that neither parent was a small business owner or had a clerical or professional occupation, on average. All other students were assigned to the Some Resources category.

Number of books in the home (students):

1) $0-10$
2) $11-25$
3) $26-100$
4) $101-200$
5) More than 200

Number of home study supports (students):

1) None
2) Internet connection or own room
3) Both
Number of children's books in the home (parents):
4) $0-10$
5) $11-25$
6) $26-50$
7) $51-100$
8) More than 100

Highest level of education of either parent (parents):

1) Finished some primary or lower secondary or did not go to school
2) Finished lower secondary
3) Finished upper secondary
4) Finished post-secondary education
5) Finished university or higher

## Highest level of occupation of either parent (parents):

1) Has never worked outside home for pay, general laborer, or semi-professional (skilled agricultural or fishery worker, craft or trade worker, plant or machine operator)
2) Clerical (clerk or service or sales worker)
3) Small business owner
4) Professional (corporate manager or senior official, professional, or technician or associate professional)

students were from homes with more than 100 books in total, and more than half (52\%) reported having both their own room and an Internet connection at home. Across the countries participating in both studies at the fourth grade, on average, 30 percent of the students had at least one parent that had earned a university degree and 36 percent had at least one parent in a professional occupation, and the majority of students (58\%) had more than 25 children's books at home.

Exhibit 4.3 presents the results for the TIMSS 2011 eighth grade assessment for the Home Educational Resources scale, which was created based on students' reports about three of the five types of home resources that comprised the fourth grade Home Resources for Learning scale: number of books in the home, availability of two home study supports, and parents' education. The second page of the exhibit provides detail about the questions forming the scale and the categorization of responses. Students were scored according to the availability of the three home resources, with Many Resources corresponding to more than 100 books in the home, having their own room and an Internet connection, and at least one parent having completed university, on average. Few Resources corresponds, on average, to having 25 or fewer books, neither home study support, and neither parent having gone beyond upper secondary school.

Countries are ordered by the percentage of students in the Many Resources category, with the eighth grade countries on the first page of the exhibit and the ninth grade and benchmarking participants on the second page. Internationally, on average, two-thirds of the eighth-grade students (67\%) were assigned to the Some Resources category. Twelve percent, on average, were in the Many Resources category and 21 percent internationally were in the Few Resources category, with a 115-point difference in their average mathematics achievement ( 530 vs. 415).

Exhibit 4.4 provides supporting detail about the availability of the specific home resources included in the Home Educational Resources scale for the eighth grade assessment. Across the countries participating at the eighth grade, on average, one-fourth of the students had more than 100 books in their home, more than half (53\%) reported having both their own room and an Internet connection at home, and about one-third (32\%) had at least one parent that had earned a university degree.

## Students Spoke the Language of the Test

TIMSS has previously shown that, with some exceptions, countries with large proportions of students from homes where the language of the test (and consequently the language of instruction) is not often spoken had lower average mathematics achievement than students who spoke the language of the test more often. Because learning any school subject is dependent on having a mastery of the language of instruction, which in turn is influenced by children's early language experiences, the language or languages spoken at home and how they are used are important factors in subsequent school achievement. As formal mathematics instruction begins, children are likely to be at an initial disadvantage if their knowledge of the language of instruction is substantially below the expected level for their age.

Exhibit 4.5 shows parents' reports about whether students who participated in the fourth grade TIMSS 2011 assessment spoke the language of the test before starting school. For students in the fourth grade, 91 percent across countries, on average, spoke the language of the test before starting school. However, the 9 percent who did not speak the language of the test before starting school had lower average achievement on TIMSS 2011 ( 477 vs. 501). The results for the sixth grade and benchmarking students show that only about one-fourth (26\%) of the students in Botswana spoke the language of the test before starting school, and that these students had higher achievement.

Reported by Students
Students were scored according to their responses concerning the availability of three home educational resources on the Home Educational Resources scale. Students with Many Resources had a score of at least 12.5 , which is the point on the scale corresponding to students reporting that they had more than 100 books in the home and two home study supports, and that at least one parent had finished university, on average. Students with Few Resources had a score no higher than 8.2 , which is the scale point corresponding to students reporting that they had 25 or fewer books in the home, neither of the two home study supports, and that neither parent had gone beyond upper-secondary education, on average. All other students were assigned to the Some Resources category.

## Number of books in the home:

1) $0-10$
2) $11-25$
3) $26-100$
4) $101-200$
5) More than 200

Highest level of education of either parent:

1) Finished some primary or lower secondary or did not go to school
2) Finished lower secondary
3) Finished upper secondary
4) Finished post-secondary education
5) Finished university or higher

Number of home study supports:

1) None
2) Internet connection or own room
3) Both

Reported by Students

| Country | Percent of Students with |  |  |

* Available only for countries that administered both TIMSS and PIRLS to the same fourth grade students because this item was included in the PIRLS Home Questionnaire completed by parents.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement.
An "r" indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An "s" indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

In the TIMSS 2011 eighth grade assessment, students themselves reported on how often they speak the language of the test at home. As shown in Exhibit 4.6, for the eighth grade students, on average across countries, 79 percent always or almost always speak the language of the test at home, with 17 percent sometimes speaking it and 4 percent never speaking it. As with the fourth grade, mathematics achievement was higher for students who frequently speak the language of the test at home (469), compared to those who sometimes (443) or never (421) do so. Among the ninth grade participants, both Botswana and South Africa had very low percentages of students always or almost always speaking the language of the test at home ( $12 \%$ and $26 \%$, respectively).

## Parents' Educational Expectations for Their Children

Studies over the past several years have found a positive relationship between parental aspirations for their children and academic achievement. For example, researchers studying longitudinal effects in the United States found that more communication between parents and students and higher parents' aspirations resulted in higher student achievement (Hong \& Ho, 2005). Across four ethnic groups, parents' educational aspiration was the most powerful predictor in increasing student educational aspiration; ultimately, the greater the student's own educational expectations, the greater the student's academic achievement.

Exhibit 4.7 presents parents' reports about their educational expectations for their children according to four education levels from highest to lowest: postgraduate degree, university degree, post-secondary, and upper secondary (or lower). Results are shown for countries that administered both TIMSS and PIRLS fourth grade assessments to the same fourth grade students. Across the TIMSS 2011 participants, parents have very high educational expectations for their children (to the extent that some parents may have misunderstood the question). Nearly one-third ( $30 \%$ ) of the fourth grade students have parents who expect them to attain a postgraduate degree and another third (35\%) are expected to graduate from university. Still, there was considerable variation in results across and within countries.

Consistent with other research, the results show a positive relationship between parents' aspirations and students' average mathematics achievement. Across the fourth grade countries, students had higher average mathematics achievement with each higher education level of expectation, to the extent that there was a 79-point difference between students whose parents expected a postgraduate degree at one end of the continuum and those expecting upper secondary school (or lower) at the other end of the continuum (528 vs. 449). The results for the sixth grade and benchmarking participants mirror the results at the fourth grade.

Exhibit 4.8 presents students' reports of their educational aspirations from the TIMSS 2011 eighth grade assessment. As shown on the first page and similar to the parents of the fourth grade students, eighth grade students had high expectations for further education, such that some students also may have misunderstood the question. However, looking at the countries that administered TIMSS and PIRLS to the same students at the fourth grade and also participated at the eighth grade, there was some degree of correspondence between the parents' responses and those by eighth grade students Almost

one-third (29\%) of the eighth grade students expect to attain a postgraduate degree and more than one-fourth ( $27 \%$ ) expect to graduate from university. Fifteen percent of the eighth grade students indicated that they did not know how far in school they would go.

The eighth grade results also show a positive relationship between educational aspirations (in this case those of the students themselves) and average mathematics achievement. Across the eighth grade countries, the students at each higher education level of expectation had higher average mathematics achievement than the level below. Students expecting a postgraduate degree had a 102-point advantage in average achievement compared to those expecting to go no further than upper secondary school, a full standard deviation on the TIMSS achievement scale (504 vs. 402). The results for the ninth grade and benchmarking participants were similar to the results at the eighth grade.

## Children Were Engaged In Numeracy Activities Before Beginning Primary School

There is increasing evidence that participating in numeracy and literacy activities during the preschool years can have beneficial effects on children's later acquisition of numeracy and literacy skills. For example, a large study in England recently found that a composite variable of seven home activitiesbeing read to, going to the library, playing with numbers, painting and drawing, being taught letters, being taught numbers, and songs/poems/rhymes-had greater predictive power for literacy and numeracy achievement than any other variables studied, including socio-economic status, parents' education, and household income (Melhuish et al., 2008).

To examine children's early numeracy experiences and as an accompaniment to the PIRLS Early Literacy Activities scale, TIMSS 2011 has included an Early Numeracy Activities scale in the fourth grade assessment for the first time. As with the other scales developed for TIMSS 2011, IRT was used to summarize the results.

Exhibit 4.9 presents the results for the TIMSS 2011 Early Numeracy Activities scale for countries that administered both TIMSS and PIRLS to the same fourth grade students. Students were scored according their parents' frequency of doing six activities with them: saying counting rhymes or singing counting songs, playing with number toys, counting different things, playing games involving shapes, playing with building blocks or construction toys, and playing board games or card games. Students Often engaged in early numeracy

TIMSS \& PIRLS
activities had parents who reported "often" doing three of the six activities with them and "sometimes" doing the other three, on average. Students Never or Almost Never engaged in such activities had parents "never or almost never" doing three of the six activities with them and "sometimes" doing the other three, on average.

Internationally, across the countries at the fourth grade, 49 percent of the students had parents that Often engaged them in early numeracy activities, and an additional 45 percent had parents that Sometimes engaged them in early numeracy activities. The fourth grade students whose parents Often engaged them had higher average achievement than the students whose parents only Sometimes engaged them in numeracy activities (510 vs. 493). In several countries, a small percentage of students had parents who rarely did any of the numeracy activities with them, and these students typically had low average mathematics achievement. The countries that participated at the sixth grade had relatively high percentages of students with parents who Never or Almost Never engaged them in early numeracy activities, comparable to the country with the highest percentage at fourth grade.

## Students Attended Preprimary Education

Preprimary education, in the form of preschool, kindergarten, or an early childhood education program, plays an important role in preparing children for primary school. For example, PIRLS 2006 found a positive relationship between years of preprimary education and reading achievement in the fourth grade. Also, recent analyses of longitudinal data in the United States and England found that preschool attendance was positively related to enhanced school performance, and that the duration of attendance was associated with greater academic improvement (Tucker-Drob, 2012; Sammons et al., 2002). Besides giving students an early start in school and life, there are also broader reasons for countries to invest in preschool (Economist Intelligence Unit, 2012). For example, preprimary education provides an avenue for overcoming children's disadvantages and can help to break the generational repetitive cycle of poverty and low achievement.

Although there is considerable variation across countries, according to the TIMSS 2011 Encyclopedia, some countries already have mandatory preprimary education (e.g., Austria, Hungary, and the Netherlands), some have nearly 100 percent enrollment even though attendance is not mandatory (e.g., Australia, Croatia, and Singapore), and a number of the remaining countries are working

Reported by Parents
Students were scored according to their parents' frequency of doing the six activities on the Early Numeracy Activities scale. Students Often engaged in early numeracy activities had a score on the scale of at least 10.3, which corresponds to their parents"often" doing three of the six activities with them and "sometimes" doing the other three, on average. Students Never or Almost Never engaged in such activities had a score no higher than 6.9, which corresponds to parents "never or almost never" doing three of the six activities with them and "sometimes" doing the other three, on average. All other students had parents who Sometimes engaged them in early numeracy activities.

* Available only for countries that administered both TIMSS and PIRLS to the same fourth grade students because the items for this scale were included in the PIRLS Home Questionnaire completed by parents.
Centerpoint of scale set at 10 .
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement.
An " $r$ " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An " $s$ " indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

to increase enrollment in preprimary education. Of course, school policies of entering primary school at older ages (e.g., age 7 in Finland, Lithuania, and Sweden) permit opportunities for more years of preschool attendance than when children start primary school at younger ages (e.g., age 4 or 5 in England, Ireland, the Netherlands, New Zealand, and Northern Ireland). Exhibit C. 1 in Appendix C contains information across countries, about the different policies and practices about the age of entry to primary school.

Exhibit 4.10 presents the TIMSS 2011 parents' reports on the number of years their children participated in preprimary education for countries that administered both TIMSS and PIRLS to the same fourth grade students. In addition, for all participants in the fourth grade TIMSS 2011 assessment, the exhibit presents National Research Coordinators' reports of whether or not there was a national preprimary curriculum that includes mathematics skills. It is noted that these preprimary curricula may involve only rudimentary numeric and spatial skills as well as perhaps experiencing some technology, yet two-thirds of the TIMSS 2011 fourth grade countries indicated that their preprimary curriculum made such provision, as did Botswana among the sixth grade countries and all the benchmarking participants.

Although attendance in preprimary education differed dramatically from country to country, on average, 43 percent of the fourth grade students had at least three years of preprimary education and another 33 percent had more than one year. These students had higher average achievement than their counterparts (11\%) with only one year or less of preprimary education (507 and 498 vs. 479, respectively). Most notably, however, the 13 percent of students, on average, that did not attend preschool had much lower average mathematics achievement (457). There was a range across countries, but the majority of students did not attend preschool in Azerbaijan (64\%) and Saudi Arabia (52\%). Also, among the sixth grade participants, the majority of students in Botswana (56\%) did not attend preprimary education.

## Students Could Do Early Numeracy Tasks When Began Primary School

Considering that 1) parents are students' first teachers and many parents make great efforts to foster their children's literacy and numeracy skills, and 2) substantial percentages of students in some countries have attended several years of preprimary education, it is not surprising that many students begin primary school with some numeracy skills. Again, however, it is recognized
that the earlier students start primary school, the fewer years they will have had available for preprimary education.

To provide information about the extent to which students enter primary school equipped with some basic skills as a foundation for formal mathematics instruction, the TIMSS 2011 fourth grade assessment has, for the first time, included a set of questions asking parents how well their child could do the following early numeracy tasks when he or she first entered primary school: count by himself/herself, recognize different shapes (e.g., square, triangle, and circle), recognize the written numbers from 1 to 10 , write the numbers from 1 to 10 , do simple addition, and do simple subtraction.

A number of recent studies have shown a positive relationship between early numeracy and literacy skills and later achievement in primary school. For example, an analysis of a national sample of kindergarten students from the US early childhood longitudinal study showed that fifth grade achievement in mathematics, science, and reading was positively related to their skills in these areas in their kindergarten entry year (Princiotta, Flanagan, \& Hausken, 2006). Also, a recent Canadian meta-analysis of six longitudinal studies found school entry skills in mathematics and reading to be among the strongest predictors of later achievement across gender and socioeconomic backgrounds (Duncan, et al., 2007). More specifically, the authors found that early mathematics skills had the greatest predictive power.

Exhibit 4.11 presents the TIMSS 2011 results for the Early Numeracy Tasks scale. Students were scored according to their parents' responses to how well their children could do the six tasks, with some being able to do all six tasks Very Well, on average, and some doing the six tasks Not Well, on average. There was some variation, but across the fourth grade countries, on average, almost one-fourth of parents ( $25 \%$ ) reported that their children entered primary school able to perform the six early numeracy tasks Very Well, and almost three-fourths (71\%) Moderately Well. Internationally, mathematics achievement at the fourth grade was substantially higher for those students whose parents reported their children could perform the activities Very Well than for the students whose parents reported Moderately Well (524 vs. 492). Average achievement was much lower (451) for those students (4\%) whose parents reported that their children could do all six numeracy tasks "not very well" or "not at all." This achievement relationship also was evident among the sixth grade and benchmarking participants.

Reported by Parents
Students were scored according to their parents' responses to how well their children could do the six tasks on the Early Numeracy Tasks scale. Students who could do numeracy tasks Very Well had a score on the scale of at least 12.5, which corresponds to their parents reporting that the students could do all six numeracy tasks (the first four at the highest level, as well as do simple addition and subtraction). Students doing the tasks Not Well had a score no higher than 6.4, which corresponds to parents reporting that students could do the first four tasks at a minimal level (responded in the second lowest category) and could not do simple addition and subtraction, on average. All other students could do the numeracy tasks Moderately Well when they began primary school.

## Chapter 5

## School Resources for Teaching Mathematics

The most successful schools tend to have students that are relatively economically affluent, speak the language of instruction, and begin school with early numeracy skills. Successful schools also are likely to have better working conditions and facilities as well as more instructional materials, such as books, computers, technological support, and supplies.

The learning environment of the school can be a positive influence, encouraging a positive attitude toward academic excellence and facilitating classroom instruction. Considerable research has shown that higher levels of school resources are associated with higher achievement. However, the relationship between resources and achievement is complicated. First, a school can have a more socioeconomically advantaged student population, for example, because of its location or because it competes for students. Second, the school system can invest more money into schools for such things as facilities, teachers' salaries, equipment, and materials. It follows that the most successful schools are likely to have more socioeconomically advantaged students and better resources.

## Schools with Students from

## Advantaged Home Backgrounds

The home backgrounds of students attending a school can be closely related to the learning environment, with the two reinforcing each other and being strongly linked to academic achievement. Students from home backgrounds supportive of learning are likely to have more positive attitudes toward learning and, perhaps, even better discipline. Beyond that, parents that have high educational expectations for their children are more likely to take an active interest in the quality of teachers and school facilities.

## School Location

Depending on each country's characteristics, a school's location can have a substantial impact on whether the students attending that school typically are from economically and educationally advantaged home backgrounds. Also, depending on the country, the location of the school can provide access to important additional resources (e.g., libraries, media centers, or museums) or mean that the school is relatively isolated.

To provide some information about the urbanicity of each school's location, TIMSS 2011 asked principals to describe the population size of the city, town, or area in which their schools were located. For the fourth grade mathematics assessment, Exhibit 5.1 shows the percentages of students together with their average achievement for schools located in cities, towns, or areas of three different population sizes: cities of more than 100,000; cities or towns of 15,001 to 100,000 ; and small towns, villages, or rural areas of 15,000 or fewer people. Countries are presented in alphabetical order with the fourth grade on
the first page of the exhibit, followed by the sixth grade and the benchmarking participants on the second page.

On average, across the fourth grade countries, 31 percent of the students attended schools in cities with more than 100,000 people, 27 percent attended schools in cities or towns of 15,001 to 100,000, and 42 percent in small towns, villages, or rural areas. In general, the fourth grade students attending schools in the largest cities had the highest average mathematics achievement (501), followed by students in medium sized cities (489), and then those in smaller towns and rural areas (477). While this pattern held for the majority of the countries in the fourth grade assessment, there were also other patterns. In some countries, students attending schools in medium sized cities of 15,001 to 100,000 had higher average achievement than students in schools in larger cities, or there was not much difference in average achievement between the two. There were also a number of countries where average mathematics achievement was highest among students attending schools in small towns or rural areas. The countries that assessed TIMSS 2011 in the sixth grade had relatively large percentages of students ( $64-77 \%$ ) attending schools in small towns or rural areas, and these students had lower average mathematics achievement than students in schools in large or medium sized cities.

Exhibit 5.2 shows principals' reports about school location for the TIMSS 2011 eighth grade assessment, with percentages of students and average achievement for the eighth grade students on the first page and results for countries assessing the ninth grade and benchmarking participants on the second page. Compared to the fourth grade assessment, the results indicated a slight shift away from small towns and rural areas into large cities. For the eighth grade assessment, 37 percent of students were attending schools in cities with a population more than $100,000,28$ percent were attending schools in medium sized cities or towns of 15,001 to 100,000 , and 35 percent in small towns or rural areas of 15,000 or fewer people. Average achievement differences among students attending the three types of schools were more pronounced than at the fourth grade, and more strongly related to degree of urbanicity, with average achievement highest in the big-city schools (484), next highest in schools in medium sized cities (463), and lowest in schools in small towns or rural areas (450). As with the fourth grade, this pattern did not hold in all countries and there was considerable variation.

## School Composition by Student Background

Ever since the Coleman report (Coleman, et al., 1966), researchers have recognized that the compositional characteristics of a school's student body can affect student achievement. Essentially, students from disadvantaged backgrounds typically have higher achievement if they attend schools where the majority of students are from advantaged backgrounds. To provide information on this topic, TIMSS routinely asks school principals to report on two demographic characteristics of their schools:

- Economic home background; and
- Language home background.

Previous assessments have found both to be strongly related to average mathematics achievement. For example, in TIMSS 2007 the mathematics achievement of students attending schools with a higher proportion of economically advantaged students was higher than for those attending schools with large proportions of disadvantaged students. Also, mathematics achievement was highest for students in schools where most students spoke the language of the TIMSS assessment as their first language, and was progressively lower as percentages of students not having the TIMSS language as their first language increased.

Exhibit 5.3 presents, for participants in the TIMSS 2011 fourth grade assessment, principals' economic categorizations of their schools according to three categories that are fully described on the second page of the exhibit. To summarize, the More Affluent schools had more than one-fourth of their students from affluent home backgrounds and not more than one-fourth from disadvantaged home backgrounds, and the More Disadvantaged schools had the reverse situation. The other schools were "in between." Internationally, the students were distributed relatively equally across the three types of schools. On average, across countries at the fourth grade, 36 percent of the students attended schools with relatively more affluent students than disadvantaged students, and students in these schools had the highest average achievement (508). At the other end of the range, 30 percent of the students attended schools with relatively more disadvantaged students than affluent students, and students in these schools had the lowest average achievement (470). Although this overall achievement pattern was observed in most countries and benchmarking participants, there was a wide variation among participants in the percentages of students attending the three different economic categories of schools.

Exhibit 5.4 presents principals' economic categorizations of their schools for participants in the TIMSS 2011 eighth grade assessment. Similar to the fourth grade assessment, internationally the students were distributed relatively equally across the three types of schools, with 32 percent of the eighth grade students attending schools with relatively more affluent than disadvantaged students and 36 percent attending schools with relatively more disadvantaged than affluent students. Again, the percentages in each school category varied considerably across countries. Also similar to the fourth grade assessment, average mathematics achievement was highest among the eighth grade students attending schools with relatively more affluent students (494) and lowest among students attending schools with relatively more disadvantaged students (448).

Exhibit 5.5 presents, for participants in the fourth grade assessment, principals' categorizations of their schools according to the percentage of students who had the language of the TIMSS 2011 assessment as their native language. Approximately three-fourths of the fourth grade students (73\%) were in schools where almost all students (more than $90 \%$ ) spoke the language of the TIMSS test as their native language, 15 percent were in schools where the majority of students (51-90\%) were native speakers of the TIMSS assessment language, and 13 percent were in schools where half the students (or less) spoke the language of the test as their native language. On average across the fourth grade countries, mathematics achievement was highest among students in schools where almost all students were native speakers of the TIMSS assessment language (491), next highest in schools where $51-90 \%$ of students were native speakers (482), and lowest in schools where half the students or less were native speakers (471). Among countries participating at the sixth grade, Botswana was notable for having almost all students (92\%) in schools with half or less native speakers.

Exhibit 5.6 presents principals' categorizations of their schools in terms of their students being native speakers of the TIMSS assessment language for participants in the eighth grade assessment. Similar to the fourth grade assessment, most eighth grade students (69\%) were in schools where almost all students (more than $90 \%$ ) spoke the language of the TIMSS assessment as their native language, 13 percent were in schools where the majority of students (51-90\%) were native speakers of the TIMSS assessment language, and 17 percent were in schools where half the students (or less) spoke the language of the assessment as their native language. Similar to the fourth grade, the eighth grade students in schools with the most native speakers had higher average achievement (471) than those in schools with fewest native speakers (461), but the achievement gap between the two was smaller than at the fourth grade.

Reported by Principals

| Country |  | More Affluent - Schools Where More than $25 \%$ of Students Come from Economically Affluent Homes and Not More than 25\% from Economically Disadvantaged Homes |  | Neither More Affluent nor More Disadvantaged |  | More Disadvantaged - Schools Where More than 25\% of Students Come from Economically Disadvantaged Homes and Not More than 25\% from Economically Affluent homes |  |

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An " $r$ " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An "s" indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

Approximately what percentage of students in your school have the following backgrounds?

1) Come from economically disadvantaged homes
 $\bigcirc$
2) Come from economically affluent homes-------------------->>>

More Affluent - Schools where more than 25\% of students come from economically affluent homes and not more than $25 \%$ from economically disadvantaged homes

More Disadvantaged - Schools where more than $25 \%$ of students come from economically disadvantaged homes and not more than $25 \%$ from economically affluent homes

Neither More Affluent nor More Disadvantaged - All other possible response combinations

About how many of the students in your school can do the following when they begin primary/elementary school?

| More than | 51-75\% | 25-50\% | Less than |
| :--- | :---: | :---: | :---: |
| 75\% |  |  | 25\% |
|  |  |  |  |

Principals' responses across the three items were averaged and their students were assigned to categories based on a 4-point scale: Less than $25 \%=1,25-50 \%=2,51-75 \%=3$, and More than $75 \%=4$. More than $75 \%$ indicates an average greater than 3.25. 51-75\% indicates an average greater than 2.5 through 3.25 . $25-50 \%$ indicates an average of 1.75 through 2.5. Less than $25 \%$ indicates an average less than 1.75 .

Schools Where Students Are Ready to Learn
An important element of school readiness is having students with the prerequisite skills for the curriculum for their grade-that is, students academically ready to learn. Furthermore, students who begin school with higher numeracy skills tend to maintain that advantage. For example, the Early Childhood Longitudinal Study conducted in the United States found that of students in the highest one-third in mathematics achievement in kindergarten, 67 percent also were in the highest one-third in fifth grade, and that the majority of students in the lowest one-third as kindergartners also were in the lowest one-third in fifth grade (Princiotta, Flanagan, \& Hausken, 2006).

TIMSS collected information about this important issue in the fourth grade assessment by asking school principals to estimate the percentages of students entering their schools able to perform each of three early numeracy skills: count up to 100 or higher, recognize all 10 written numbers from 1 to 10 , and write all 10 numbers from 1 to 10 . Of course, in countries where students start school at a young age (e.g., age 4 or 5 in England, Ireland, the Netherlands, New Zealand, and Northern Ireland), students have had fewer years to develop numeracy skills prior to starting school.

Exhibit 5.7 presents the TIMSS results for the percentages of students entering school with early numeracy skills and their average mathematics achievement. The first page of the exhibit shows that 32 percent of the fourth grade students, on average, were in schools where most children (more than $75 \%$ ) entered school with early numeracy skills, and a further 17 percent in schools where $51-75 \%$ have such skills. Students in these schools had higher average mathematics achievement than those in schools where fewer students entered with numeracy skills. In particular, the 35 percent in schools where few students began school with numeracy skills had the lowest average mathematics achievement.

## Schools with Sufficient Facilities, Books, and Technology

Studies have shown that resources are crucial for improving schooling, perhaps even more so in developing countries than in economically developed countries, where adequate school structures and material resources can be taken for granted (Lee \& Zuze, 2011). The extent and quality of school resources can have an important impact on the quality of classroom instruction.

TIMSS \& PIRLS

## School Resources

To provide information on the extent to which school resources are available to support mathematics instruction, TIMSS routinely asks school principals about the degree of shortages or inadequacies in general school resources (materials, supplies, heating/cooling/lighting, buildings, space, staff, and computers) as well as about resources specifically targeted to support mathematics instruction (specialized teachers, computer software, library materials, audiovisual resources, and calculators). Although "adequacy" can be relative, in each TIMSS assessment there has been a strong positive relationship between principals' perceptions of the absence of school resource shortages and average mathematics achievement.

Exhibit 5.8 presents the TIMSS 2011 results for the Mathematics Resource Shortages scale for participants in the fourth grade assessment. Students were scored according to their principals' responses concerning twelve school and classroom resources (see the second page of the exhibit for details). Countries are ordered according to the percentage of students (from most to least) in schools Not Affected by resource shortages. Schools in this category had principals who reported that shortages affected instruction "not at all" for six of the twelve resources and only "a little" for the other six, on average. There was substantial variation across the fourth grade countries-from 0 to 64 percent, with an average of 25 percent of students attending well-resourced schools.

Students in schools where instruction was Affected A Lot had principals who reported that shortages affected instruction "a lot" for six of the twelve resources and "some" for the other six, on average. Many countries were fortunate to have very few, if any, students in such poorly resourced schools. However, this was a crucial problem in some countries. At 462 points, on average, mathematics achievement for students in schools Affected A Lot by resource shortages was substantially lower ( 35 points) than for students in schools Not Affected by resources shortages.

Exhibit 5.9 presents the results for the Mathematics Resource Shortages scale for participants in the TIMSS 2011 eighth grade assessment. As shown on the second page of the exhibit, the eighth grade scale consisted of essentially the same twelve resources as the fourth grade. The results also were similar to the fourth grade, with wide variation across countries in the percentage of eighth grade students attending schools Not Affected by resource shortages ( $1-71 \%$ ), with an international average of 25 percent. Furthermore, the average achievement gap between students attending schools where instruction was

Reported by Principals
Students were scored according to their principals' responses concerning twelve school and classroom resources on the Mathematics Resource Shortages scale. Students in schools where instruction was Not Affected by resource shortages had a score on the scale of at least 11.1, which corresponds to their principals reporting that shortages affected instruction "not at all" for six of the twelve resources and "a little" for the other six, on average. Students in schools where instruction was Affected A Lot had a score no higher than 6.8, which corresponds to their principals reporting that shortages affected instruction "a lot" for six of the twelve resources and "some" for the other six, on average. All other students attended schools where instruction was
Somewhat Affected by resource shortages.

Reported by Principals
Students were scored according to their principals' responses concerning twelve school and classroom resources on the Mathematics Resource Shortages scale. Students in schools where instruction was Not Affected by resource shortages had a score on the scale of at least 11.1, which corresponds to their principals reporting that shortages affected instruction "not at all" for six of the twelve resources and "a little" for the other six, on average. Students in schools where instruction was Affected A Lot had a score no higher than 7.3, which corresponds to their principals reporting that shortages affected instruction "a lot" for six of the twelve resources and "some" for the other six, on average. All other students attended schools where instruction was
Somewhat Affected by resource shortages.

How much is your school's capacity to provide instruction affected by a shortage or inadequacy of the following?

## B. Resources for Mathematics Instruction

Not Affected by resource shortages and those attending schools where it was Affected A Lot was 35 points for eighth grade, the same as for the fourth grade.

## Teacher Working Conditions

There is evidence that, in some countries, teacher shortages may exist partly as a result of poor working conditions. For example, a review of research from the United States suggests that teachers who leave the profession after just a few years are more likely to leave because of poor working conditions than because of low pay (Johnson, 2006). Although teachers' reports across countries are related to their expectations and need to be considered in the context of variations in economic situations, TIMSS 2011 asked the students' teachers to provide their views on the adequacy of their working conditions. More specifically, teachers were asked about five potential problem areas:

- The school building needing significant repair;
- Classrooms being overcrowded;
- Teachers having too many teaching hours;
- Teachers not having adequate workspace; and
- Teachers not having adequate instructional materials and supplies.

Exhibit 5.10 presents the results for the TIMSS 2011 fourth grade assessment for the Teacher Working Conditions scale. Countries are ordered by the percentage of students whose teachers reported few problems with their working conditions. Teachers with Hardly Any Problems with their working conditions reported "not a problem" for three of the five areas and only "minor problems" for the other two, on average. There was a range of results across the fourth grade countries-from 4 to 49 percent, with an average of 26 percent of students in schools where teachers had Hardly Any Problems.

For this scale, the remaining two categories were Minor Problems and Moderate Problems. Teachers with Moderate Problems reported "moderate problem" for three of five conditions and "minor problem" for the other two, on average. About half of the students, on average, across the fourth grade countries were in schools where teachers had Minor Problems and about onefourth were in schools with Moderate Problems. Students whose teachers reported Moderate Problems had somewhat lower mathematics achievement, on average, than those whose teachers reported Minor Problems, and those
students in turn had lower achievement than students whose teachers reported Hardly Any Problems (487, 491, and 498, respectively). In general, the results for the sixth grade and benchmarking participants followed the same pattern, with agreement between teacher reports and higher achievement for students in better school conditions. However, substantial percentages of students (45-59\%) in the sixth grade countries had teachers reporting Moderate Problems with school conditions. Exhibit 5.11 presents the results for the Teacher Working Conditions scale for the TIMSS 2011 eighth grade assessment. The eighth grade scale was based on responses by the students' mathematics teachers to statements about the same five problem areas as the fourth grade. Eighth grade mathematics teachers expressed about the same level of satisfaction with working conditions as fourth grade teachers, with 21 percent of students in schools whose teachers reported Hardly Any Problems and 31 percent in schools with Moderate Problems. The average mathematics achievement difference between these two groups of students was 15 points ( 479 vs. 464).

## Difficulties Filling Vacancies for Mathematics Teachers

Recent research suggests that mathematics teachers are in relatively short supply in some countries, and that the impending retirement of aging teachers will further contribute to this shortage (Ingersoll \& Perda, 2010). TIMSS Advanced 2008 noted that, in several countries, not only were teachers of advanced mathematics nearing retirement age, but relatively few students were considering mathematics as a career option (Mullis, Martin, Robitaille, \& Foy, 2009).

Exhibit 5.12 summarizes school principals' reports from the TIMSS 2011 eighth grade assessment about difficulties in filling vacancies for mathematics teachers. In most countries, on average, eighth grade students were in schools where principals reported that there were no vacancies (58\%) or that vacancies were easy to fill ( $23 \%$ ). Average mathematics achievement was the same for these two groups of students (468). However, average achievement was somewhat lower among the 15 percent of students in schools where vacancies were somewhat difficult to fill (458), and especially among the 4 percent in schools where vacancies were very difficult to fill (433).

Reported by Teachers
Students were scored according to their teachers' responses concerning five potential problem areas on the Teacher Working Conditions scale. Students whose teachers had Hardly Any Problems with their working conditions had a score on the scale of at least 11.3, which corresponds to their teachers reporting "not a problem" for three of five areas and "minor problem" for the other two, on average. Students whose teachers had Moderate Problems had a score no higher than 8.7, which corresponds to their teachers reporting "moderate problem" for three of five conditions and "minor problem" for the other two, on average. All other students had teachers that reported Minor Problems with their working conditions.

In your current school, how severe is each problem?

Reported by Teachers
Students were scored according to their teachers' responses concerning five potential problem areas on the Teacher Working Conditions scale. Students whose teachers had Hardly Any Problems with their working conditions had a score on the scale of at least 11.7, which corresponds to their teachers reporting "not a problem" for three of five areas and "minor problem" for the other two, on average. Students whose teachers had Moderate Problems had a score no higher than 8.9, which corresponds to their teachers reporting "moderate problem" for three of five conditions and "minor problem" for the other two, on average. All other students had teachers that reported Minor Problems with their working conditions.

## Size of School Library

Libraries, both within the school and in the local community, provide a range of reading materials and other resources from which teachers can draw to expand their instructional approaches, and from which students can choose books for their own learning and enjoyment. Also, with the growing use of technology, libraries increasingly are becoming media centers offering Internet access to a wide range of materials, with the potential to improve achievement in all areas, including mathematics.

Exhibit 5.13 presents principals' reports about the existence and size of school libraries for participants in the TIMSS 2011 fourth grade assessment. In considering the results in this exhibit, it is important to realize that, because of variation in policies across countries regarding school libraries and classroom libraries, some countries have well-resourced classroom libraries rather than a larger central library, so the lack of a school library does not necessarily mean that children do not have access to a variety of books. Also, primary schools tend to be smaller than middle and secondary schools, and may have small libraries as a result of their small enrollments.

On average, across the fourth grade countries, 32 percent of the students attended schools (for the most part primary schools) having well-resourced school libraries with more than 5,000 book titles. Another 38 percent of the students attended schools having libraries with between 501 and 5,000 book titles, and 17 percent attended schools having smaller library collections of 500 book titles or fewer. On average internationally, 13 percent of fourth grade students attended schools with no school library.

Average mathematics achievement was positively related to school library size, with the fourth grade students attending schools with well-resourced school libraries having the highest achievement and students with no school library the lowest achievement ( 506 vs. 474). For countries at the sixth grade, there were few students in schools with libraries having more than 5,000 book titles, and high percentages of students with no school library.

## Schools with Computers Available for Instruction

Recent research reviews suggest that computer use continues to grow in mathematics and science instruction. For example, a meta-analysis of the impact of computer technology on mathematics education in US classrooms found significant positive effects, and in particular that computer technology had a stronger effect in promoting mathematics achievement among elementary compared to secondary school students (Li \& Ma, 2010).

Exhibit 5.14 shows principals' reports about the availability of computers for instruction for participants in the TIMSS fourth grade assessment. Internationally, 38 percent of the fourth grade students, on average, were in schools that had 1 computer for every 1-2 fourth grade students, 30 percent were in schools with 1 computer for every 3-5 fourth grade students, and 24 percent were in schools with 1 computer for 6 or more students. There was considerable variation from country to country, with the highest computer-tostudent ratio in England ( $90 \%$ of students in schools with 1 computer for every $1-2$ fourth grade students) and the lowest in Iran, Tunisia, and Yemen (7\% or fewer students in such schools). On average, however, only 8 percent of the fourth grade students were in schools that did not have any computers available for instruction. The percentages of students in schools with no computers for instruction were higher for the sixth grade participants.

The relationship between computer availability and average mathematics achievement is difficult to interpret because it is highly interrelated with socio-economic levels and instructional practices. In the primary grades, computer instruction can be used for remedial purposes as frequently (if not more frequently) because it can provide an increased variety of stimulating and challenging activities. However, the fourth grade students with access to computers for instruction had higher average mathematics achievement than those students with no access to computers for instruction.

Exhibit 5.15 provides principals' reports about the availability of computers for instruction for participants in the TIMSS eighth grade assessment. Levels of computer availability are similar to the fourth grade (although a little more favorable), with 40 percent of the eighth grade students, on average, in schools having 1 computer for every $1-2$ eighth grade students, 28 percent in schools with 1 computer for every 3-5 eighth grade students, and 28 percent in schools with 1 computer for 6 or more students. Only 4 percent of the eighth grade students were in schools with no provision for computers for instruction. Eighth grade participants with 70 percent or more of students in schools with the highest computer-to-student ratio (1 computer for every 1-2 eighth grade students) included Australia, England, Georgia, Hungary, Macedonia, New Zealand, Norway, Slovenia, and, among benchmarking participants, Alberta, Colorado, and Indiana. Similar to the fourth grade, there was no relationship between computer-to-student ratio and mathematic achievement, but the 4 percent of students in schools with no computers available for instruction had lower average mathematics achievement than students in schools with some access to computers.

Reported by Principals (Does not include classroom libraries)

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement.
An " r " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students.

## Does your school have a school library?

1) Yes
2) No

If Yes,
A. Approximately how many books with different titles does your school library have (exclude magazines and periodicals)?

1) 250 or fewer
2) $251-500$
3) $501-2,000$
4) $2,001-5,000$
5) $5,001-10,000$
6) More than 10,000

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement
An "r" indicates data are available for at least 70\% but less than $85 \%$ of the students. An"s" indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

The number of students per computer was calculated by dividing the number of students by the number of computers.

1) What is the total enrollment of fourth grade students in your school as of the first day of the month TIMSS 2011 testing begins?
2) What is the total number of computers that can be used for instructional purposes by fourth grade students?

| Country |  | 1 Computer for 1-2 Students |  | 1 Computer for 3-5 Students |  | 1 Computer for 6 or More Students |  | No Computers Available |  |

The number of students per computer was calculated by dividing the number of students by the number of computers.

1) What is the total enrollment of eighth grade students in your school as of the first day of the month TIMSS 2011 testing begins?

What is the total number of computers that can be used for instructional purposes by eighth grade students?

## Chapter 6

## School Climate

Students with the highest mathematics achievement typically attend schools that emphasize academic success, as indicated by rigorous curricular goals, effective teachers, students that desire to do well, and parental support. In contrast, schools with discipline and safety problems are not conducive to high achievement. Students that attended schools with disorderly environments and reported more frequent bullying had much lower achievement than their counterparts in safe and orderly schools.

The school's educational values are reflected by the teachers, school leadership, the students themselves, and their parents. A school with a positive atmosphere toward high achievement and a rigorous academic program can overcome resource shortages and encourage students toward excellent performance. By contrast, a school with more disciplinary problems is not conducive to higher student achievement. When students are fearful and worried about their safety, for example, it is difficult to focus on academics. Chapter 6 presents the TIMSS 2011 results about positive and negative aspects of the atmosphere in schools around the world.

## Schools Emphasize Academic Success

Studies of academic optimism show that a positive school atmosphere emphasizing academic achievement can even overcome socioeconomic disadvantages (McGuigan \& Hoy, 2006). There are several dimensions of academic optimism, including a school communicating its academic emphasis through clear and rigorous academic goals. However, because individuals are the actors within schools, the effect on achievement is greatest when there is a collective influence. This includes a school administration and teachers that support and trust in students' achievement. In addition to making it clear that academic success is important, principals and teachers need to emphasize it can be achieved. Parents' support for their children's learning also contributes to a schools' collective efficacy or belief that the school's academic goals can be implemented.

## School Emphasis on Academic Success

The TIMSS 2011 School Emphasis on Academic Success scale characterizes five aspects of academic optimism:

- Teachers' understanding of the school's curricular goals;
- Teachers' degree of success in implementing the school's curriculum;
- Teachers' expectations for student achievement;
- Parental support for student achievement; and
- Students' desire to do well in school.

This set of questions was given to both students' principals and teachers, with the respective responses used to create scales.

Exhibit 6.1 shows the principals' reports on the School Emphasis on Academic Success scale for the TIMSS 2011 fourth grade assessment. As might be anticipated, principals had very positive attitudes about the emphasis on
academics in their schools, so the three regions of the scale have been described as Very High, High, and Medium. Students were scored according to their principals' characterization of their school in terms of the five aspects. Students in schools with Very High Emphasis on academic success had principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in Medium Emphasis schools had principals characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a High Emphasis on academic success.

On average, across the fourth grade countries, 8 percent of the students attended schools where the principal reported a Very High Emphasis on academic success, 58 percent a school with a High Emphasis, and 34 percent a school with a Medium Emphasis. Although the results were not entirely consistent from country to country, internationally at the fourth grade, on average, there was a direct correspondence between average mathematics achievement and principals' reports, with higher emphasis on academic success related to higher average mathematics achievement. The results were similar for the sixth grade and benchmarking participants.

Exhibit 6.2 shows the principals' reports on the School Emphasis on Academic Success scale for the TIMSS 2011 eighth grade assessment. Although similar to the fourth grade results, principals of the eighth grade schools reported slightly less emphasis on academic success, with 7 percent of the students attending a school where the principal reported a Very High Emphasis on academic success, 53 percent a school with a High Emphasis, and 41 percent a school with a Medium Emphasis (compared to $8 \%, 58 \%$, and $34 \%$, respectively, at the fourth grade). There was also a somewhat greater difference in average mathematics achievement (46 points) between students attending Very High Emphasis schools and students attending Medium Emphasis schools (495 vs. 449).

Exhibits 6.3 and 6.4 show the teachers' reports on the School Emphasis on Academic Success scale for the fourth and eighth grade assessments, respectively. The teachers' reports were remarkably similar to those of the principals for both assessments, and with each reported decrease in academic emphasis, the students had progressively lower average mathematics achievement. Similar to their principals, the eighth grade mathematics teachers reported a little less emphasis on academic success than the fourth grade teachers, but the achievement gap between students in very high and medium emphasis schools was greater at the eighth grade (54 points) than at the fourth grade ( 26 points).

Reported by Principals
Students were scored according to their principals' responses characterizing five aspects on the School Emphasis on Academic Success scale. Students in
schools where their principals reported a Very High Emphasis on academic success had a score on the scale of at least 13.1, which corresponds to their
principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a Medium Emphasis on
academic success had a score no higher than 8.9, which corresponds to their principals characterizing three of the five aspects as "medium" and the othe
two as "high," on average. All other students attended schools with a High Emphasis on academic success.

Reported by Principals
Students were scored according to their principals' responses characterizing five aspects on the School Emphasis on Academic Success scale. Students in schools where their principals reported a Very High Emphasis on academic success had a score on the scale of at least 13.3, which corresponds to their principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a Medium Emphasis on academic success had a score no higher than 9.2, which corresponds to their principals characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a High Emphasis on academic success.

Reported by Teachers
Students were scored according to their teachers' responses characterizing five aspects on the School Emphasis on Academic Success scale. Students in
schools where their teachers reported a Very High Emphasis on academic success had a score on the scale of at least 13.1, which corresponds to their
teachers characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a Medium Emphasis on
academic success had a score no higher than 8.8 , which corresponds to their teachers characterizing three of the five aspects as "medium" and the other
two as "high," on average. All other students attended schools with a High Emphasis on academic success.

Centerpoint of scale set at 10 .
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.
An " $r$ " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students.

Reported by Teachers

#### Abstract

Students were scored according to their teachers' responses characterizing five aspects on the School Emphasis on Academic Success scale. Students in schools where their teachers reported a Very High Emphasis on academic success had a score on the scale of at least 13.6 , which corresponds to their teachers characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a Medium Emphasis on academic success had a score no higher than 9.5 , which corresponds to their teachers characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a High Emphasis on academic success.

## Principals Spend Time on Leadership Activities

The effectiveness of school leadership has become a central issue, as principals worldwide are held increasingly accountable for their students' achievement outcomes. However, the effects of principal leadership are often indirect and difficult to measure. A meta-analysis of multinational studies conducted between 1986 and 1996 found that "defining and communicating the school's mission" had the largest direct effect on student achievement (Witziers, Bosker, \& Kruger, 2003), whereas a different meta-analysis of 27 studies conducted between 1978 and 2006 found strong effects for promoting teacher learning and development, and establishing goals (Robinson, Lloyd, \& Rowe, 2008).

TIMSS 2011 used research conducted in the Netherlands (ten Bruggencate, Luyten, Scheerens, \& Sleegers, 2012) to develop questions about principals' leadership styles. These questions were included in both the fourth and eighth grade assessments. Exhibit 6.5 presents principals' reports for the fourth grade about the various activities upon which they spend "a lot of time." The pattern of varying reports from country to country held for the fourth grade, the sixth grade, and the benchmarking participants.

The results for the fourth grade were averaged across countries to provide some summary data. The first two questions related to defining and communicating the school's mission, and on average, more than half of the fourth grade students ( $59 \%$ and $60 \%$ ), were in schools where this occupied "a lot" of the principal's time. The next two questions addressed monitoring whether goals are achieved by teachers and students, with just over half the students ( $53 \%$ and $57 \%$ ) in schools where principals reported spending "a lot of time" on these activities. The next two categories asked about maintaining discipline: two-thirds of students were in schools where the principal spent "a lot of time" keeping an orderly atmosphere, and 44 percent had principals that needed to spend "a lot of time" addressing disruptive student behavior. The last three areas appear to occupy less time: advising teachers, initiating projects, and participating in professional development activities.

Exhibit 6.6 summarizes principals' reports from the eighth grade assessment about time spent on leadership activities. About two-thirds of the eighth grade students were in schools where the principal reported spending "a lot of time" on defining and communicating the school's mission and in monitoring whether goals were being achieved by teachers and students. Three-fourths of the eighth grade students were in schools where the principal devoted "a lot of time" to keeping an orderly atmosphere, and more than half
had principals that needed to spend "a lot of time" addressing disruptive student behavior. Similar to the fourth grade, the last three areas-advising teachers, initiating projects, and participating in professional development activitiesappear to occupy less of the principal's time.

## Schools with Discipline and Safety Problems

The sense of security that comes from attending a school with few behavior problems and having little or no concern about student or teacher safety promotes a stable learning environment. There is increasing research showing that a safe school environment is important for students' academic achievement. On the other hand, a general lack of discipline, especially if students and teachers are afraid for their safety, does not facilitate learning. Unfortunately, community and school violence are becoming an increasing problem, especially among urban youth.

## Safe and Orderly School

There is growing evidence that students' perceived school safety adversely affects academic performance, even for primary school children (Milam, Furr-Holden, \& Leaf, 2010). It seems that safety at school can no longer be taken for granted, even at the fourth grade. To provide information on the extent to which school safety might be affecting mathematics achievement, TIMSS 2011 developed the Safe and Orderly School scale. Teachers in both the fourth and eighth grade assessments were asked the degree to which they agreed or disagreed with five statements:

- This school is located in a safe neighborhood;
- I feel safe at this school;
- This school's security policies and practices are sufficient;
- The students behave in an orderly manner; and
- The students are respectful of the teachers.

Exhibit 6.7 presents the results for the Safe and Orderly School scale for the fourth grade assessment. Students were scored according to their teachers' degree of agreement with the five statements. Students in Safe and Orderly schools had teachers that "agreed a lot" with three of the five qualities and "agreed a little" with the other two, on average. There was substantial variation across countries, but internationally, on average, across the fourth grade countries, the majority of students (53\%) were attending schools judged by
their teachers to be Safe and Orderly. Almost all of the remaining students (43\%) were in schools judged to be Somewhat Safe and Orderly. In general, only small percentages of students (4\% on average) were in schools judged Not Safe and Orderly at best, their teachers "disagreed a little" with three of the five statements and "agreed a little" with the other two, on average. Across the fourth grade countries, on average, the safer the school as reported by their teachers, the higher the students' average mathematics achievement.

Exhibit 6.8 presents the corresponding Safe and Orderly School scale results for the eighth grade assessment. Students were assigned to one of the three school orderliness categories using the same criteria as at the fourth grade, and with broadly similar results. Although almost all of the eighth grade students, on average internationally, were in Safe and Orderly or Somewhat Safe and Orderly schools, the eighth grade mathematics teachers were noticeably less positive in their reports. On average, across the eighth-grade countries, 45 percent of students (compared to $53 \%$ at the fourth grade) were attending schools judged by their teachers to be safe and orderly, 49 percent of students (compared to 43\%) were in schools judged to be Somewhat Safe and Orderly, and 6 percent of students (compared to 4\%) were in schools judged Not Safe and Orderly. The average mathematics achievement gap between students in the Safe and Orderly and Not Safe and Orderly schools also was greater at the eighth grade ( 34 points vs. 28 points).

## School Discipline and Safety

Previous TIMSS assessments have asked principals for their perceptions about the degree to which a series of discipline, disorderly, and bullying behaviors are problems in their schools, and found that having fewer problems was related to higher average achievement. Exhibit 6.9 presents the TIMSS 2011 results for the fourth grade School Discipline and Safety scale based on asking principals about the extent of ten different discipline and school safety problems (see the second page of the exhibit for the complete list of problems). Countries are ordered by the percentage of students whose principals reported few student discipline and school safety problems. Principals in schools with Hardly Any Problems with discipline or safety reported "not a problem" for five of the ten discipline and safety issues and only "minor problem" for the other five, on average. Principals in schools with Moderate Problems reported "moderate problem" for five of the ten issues and "minor problem" for the other five, on average.

TIMSS \& PIRLS

More than half of the students (61\%), on average, across the fourth grade countries were in the Hardly Any Problems category and 29 percent were in the Minor Problems category. Only 11 percent, on average, attended schools where principals reported Moderate Problems with discipline and school safety. Students whose principals reported Moderate Problems in their schools had substantially lower mathematics achievement, by 45 points on average, than students whose principals reported Hardly Any Problems (451 vs. 496).The results for the sixth grade and benchmarking participants followed a similar pattern.

Exhibit 6.10 presents the results for the School Discipline and Safety scale for the TIMSS 2011 eighth grade assessment. This scale is based on eleven discipline and school safety problems, ten of which comprised the fourth grade scale plus one additional problem more suited to older students"Physical injury to teachers or staff" (see the second page of the exhibit for the complete list of problems). Compared to the situation at the fourth grade, relatively speaking, there were fewer eighth grade students in the Hardly Any Problems category ( $38 \%$ vs. $61 \%$ ) and more in the Minor Problems category ( $49 \%$ vs. $29 \%$ ). There were similar percentages of students in schools with Moderate Problems at the fourth and eighth grades (11\% and 13\%). Looking more closely at the problems comprising the scales, the increase from fourth to eighth grade in the percentage of students in schools with discipline and safety problems is largely because eight of these problems (classroom disturbance, cheating, profanity, vandalism, theft, intimidation or verbal abuse among students, students fighting, and intimidation or verbal abuse of teachers) often were "not a problem" for fourth grade principals but more often were a "minor problem" for principals of eighth grade schools.

Reported by Teachers
Students were scored according to their teachers' degree of agreement with five statements on the Safe and Orderly School scale. Students in Safe and Orderly schools had a score on the scale of at least 10.2, which corresponds to their teachers "agreeing a lot" with three of the five qualities of a safe and orderly school and "agreeing a little" with the other two, on average. Students in Not Safe and Orderly schools had a score no higher than 6.3, which corresponds to their teachers "disagreeing a little" with three of the five qualities and "agreeing a little" with the other two, on average. All other students attended Somewhat Safe and Orderly schools.

Thinking about your current school, indicate the extent to which you agree or disagree with each of the following statements.

Reported by Teachers
Students were scored according to their teachers' degree of agreement with five statements on the Safe and Orderly School scale. Students in Safe and Orderly schools had a score on the scale of at least 10.7, which corresponds to their teachers "agreeing a lot" with three of the five qualities of a safe and orderly school and "agreeing a little" with the other two, on average. Students in Not Safe and Orderly schools had a score no higher than 6.8, which corresponds to their teachers "disagreeing a little" with three of the five qualities and "agreeing a little" with the other two, on average. All other students attended Somewhat Safe and Orderly schools.

Thinking about your current school, indicate the extent to which you agree or disagree with each

Reported by Principals
Students were scored according to their principals' responses concerning ten potential school problems on the School Discipline and Safety scale. Students in schools with Hardly Any Problems had a score on the scale of at least 9.7, which corresponds to their principals reporting "not a problem" for five of the ten discipline and safety issues and "minor problem" for the other five, on average. Students in schools with Moderate Problems had a score no higher than 7.6, which corresponds to their principals reporting "moderate problem" for five of the ten issues and "minor problem" for the other five, on average. All other students attended schools with Minor Problems.

Centerpoint of scale set at 10 .
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement
An " r " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students.

Reported by Principals
Students were scored according to their principals' responses concerning eleven potential school problems on the School Discipline and Safety scale.
Students in schools with Hardly Any Problems had a score on the scale of at least 10.7, which corresponds to their principals reporting "not a problem" for six of the eleven discipline and safety issues and "minor problem" for the other five, on average. Students in schools with Moderate Problems had a score no higher than 8.0, which corresponds to their principals reporting "moderate problem" for six of the eleven issues and "minor problem" for the other five, on average. All other students attended schools with Minor Problems.

## Students Bullied at School

In general, bullying involves aggression or negative behavior intended to harm or bother less physically or psychologically powerful persons, although a New Zealand review of the literature found a range of definitions and terminology relating bullying to violence and abuse (Carroll-Lind, 2009). There is growing evidence that bullying in schools is on the rise, especially with the emergence of cyber-bullying, and that bullying does have a negative impact on students' educational achievement. To provide data about bullying in the participating countries, TIMSS 2011 created the Students Bullied at School scale, based on how often students experienced six bullying behaviors:

- I was made fun of or called names;
- I was left out of games or activities by other students;
- Someone spread lies about me;
- Something was stolen from me;
- I was hit or hurt by other student(s); and
- I was made to do things I didn't want to do by other students.

Exhibit 6.11 provides the results for the Students Bullied at School scale for the TIMSS 2011 fourth grade assessment. Students were scored according to their responses to how often they experienced six bullying behaviors (detailed on the second page of the exhibit). Students bullied Almost Never reported never experiencing three of six bullying behaviors and each of the other three behaviors "a few times a year," on average. Internationally, across the fourth-grade countries, 48 percent of the students, on average, Almost Never experienced these bullying behaviors. However, the percentages ranged from 17 to 80 percent.

The majority of fourth grade students reported being bullied either About Monthly or About Weekly. Internationally, on average across the fourth grade countries, 32 percent of the students were reportedly bullied About Monthly and 20 percent were bullied About Weekly. Students bullied About Weekly reported experiencing each of three of the six behaviors "once or twice a month" (bullied 3-6 times a month) and, in addition, each of the other three "a few times a year," on average.

The fourth grade students' reports about being bullied were related to their average mathematics achievement on TIMSS 2011. Each successive category of increased bullying was related to a decrease in average mathematics

TIMSS \& PIRLS
achievement to the extent that there was a 32-point difference in achievement between Almost Never being bullied and being bullied About Weekly (501 vs. 469).

Exhibit 6.12 provides the results for the TIMSS 2011 eighth grade assessment for the Students Bullied at School scale, which was based on the same six bullying behaviors (detailed on the second page of the exhibit) as the fourth grade scale. In contrast to the previous section, where principals reported more school discipline and safety problems at the eighth than at the fourth grade, the eighth grade students reported experiencing somewhat less bullying behavior than the fourth grade students. On average internationally, the majority of eighth grade students (59\%) Almost Never experienced these bullying behaviors, compared to 48 percent at the fourth grade, whereas just 12 percent of the eighth grade students reported being bullied About Weekly, compared to 20 percent at the fourth grade. Similar to the fourth grade, there was a negative relationship between eighth grade students' reports about being bullied and average mathematics achievement, with students who were Almost Never bullied having achievement 32 points higher than students who reported being bullied About Weekly (473 vs. 441).

Reported by Students
Students were scored according to their responses to how often they experienced six bullying behaviors on the Students Bullied at School scale. Students bullied Almost Never had a score on the scale of at least 10.1, which corresponds to "never" experiencing three of the six bullying behaviors and each of the other three behaviors "a few times a year," on average. Students bullied About Weekly had a score no higher than 8.3, which corresponds to their experiencing each of three of the six behaviors "once or twice a month" and each of the other three "a few times a year," on average. All other students were bullied About Monthly.

Reported by Students
Students were scored according to their responses to how often they experienced six bullying behaviors on the Students Bullied at School scale. Students bullied Almost Never had a score on the scale of at least 9.6, which corresponds to "never" experiencing three of the six bullying behaviors and each of the other three behaviors "a few times a year," on average. Students bullied About Weekly had a score no higher than 7.7, which corresponds to their experiencing each of three of the six behaviors "once or twice a month" and each of the other three "a few times a year," on average. All other students were bullied About Monthly.

## Teacher Preparation

Higher mathematics achievement was related to teachers' having more teaching experience, being confident in their mathematics teaching, and being satisfied with their careers.

The majority of fourth grade students had teachers with a bachelor's degree, and even more eighth grade students had teachers with bachelor's and postgraduate degrees. At both grades, most students had teachers that reported having at least ten years of teaching experience, being very well prepared to teach the TIMSS mathematics topics, and feeling very confident in teaching mathematics.

In view of the importance of a well prepared teaching force to an effective education system, TIMSS 2011 collected a range of information about teacher education. In the TIMSS 2011 Encyclopedia, each country chapter describes the educational route to teacher certification, including any additional requirements such as passing an examination or completing an induction year. Each chapter also addresses the requirements and practices for ongoing teacher professional development. Chapter 7 provides information about teachers' education, experience, professional development, and satisfaction with their teaching careers.

## Mathematics Teachers' Formal Education

There is growing evidence that teacher preparation is a powerful predictor of students' achievement, perhaps even overcoming socioeconomic and language background factors (Darling-Hammond, 2000).

Exhibits 7.1 and 7.2 present teachers' reports about their highest level of formal education for the TIMSS 2011 fourth and eighth grade assessments, respectively. On average, internationally, across the fourth grade countries, 22 percent of the students had mathematics teachers with a postgraduate university degree, 57 percent had teachers with a bachelor's degree, 15 percent had teachers who had completed post-secondary education (usually a 3-year teacher education program), and 6 percent had teachers with an upper secondary degree. However, it is clear from examining the country-by-country results across the fourth grade, sixth grade, and benchmarking participants that different countries have different educational paths for becoming a primary level teacher. Similar results are shown in Exhibit 7.2 for the eighth grade students, although more students than at the fourth grade had teachers with bachelor's ( $63 \%$ vs. $57 \%$ ) and postgraduate university degrees ( $24 \%$ vs. $22 \%$ ).

## Teachers Majoring in Education and Mathematics

In addition to the importance of a college or university degree or advanced degree, the literature reports widespread agreement that teachers should have solid mastery of the content in the subject to be taught. For example, a metaanalysis of studies in the United States examining various teacher characteristics and student achievement found that, at least in high school, students learn more mathematics when their mathematics teachers have additional degrees or coursework in mathematics (Wayne \& Youngs, 2003).

Exhibit 7.3 shows the percentages of students in the TIMSS 2011 fourth grade assessment whose teachers had a major or specialization in primary education and if they also had a major or specialization in mathematics. Similar to the situation with formal education, there was a great deal of variation across countries in the degree of specialization by primary school teachers in mathematics education. On average across the fourth grade countries, 28 percent of the students were taught mathematics by a teacher with a major in both primary education and mathematics, and almost half (46\%) by a teacher with a major in primary education but not in mathematics. Just 10 percent of fourth grade students, on average, were taught mathematics by a teacher with a major in mathematics but not in primary education, and another 10 percent by a teacher with some other major. In several countries, one-third or more of the fourth grade and sixth grade students had mathematics teachers without university degrees (Italy, Honduras, Morocco, Romania, Tunisia, and Yemen). However, as explained in the TIMSS 2011 Encyclopedia, countries have been implementing new policies that increase their teacher education requirements.

Mathematics achievement was highest, on average, among students taught by teachers with a primary education major but not a mathematics major (501), followed by students taught by a teacher with both majors (490) and students taught by a teacher with some other major (486). Among the fourth grade students whose teachers had college degrees, average achievement was lowest among students taught by a teacher with a major in mathematics but not in primary education (457).

As shown in Exhibit 7.4, the situation for mathematics teachers of eighth grade students was somewhat different. The majority of eighth grade students were taught mathematics by teachers who had a major in mathematics but not in mathematics education (41\%), or who had a major in both (32\%). Average mathematics achievement was only slightly different for these students (468 and 471 , respectively) than for the 12 percent of students taught by teachers majoring in mathematics education but not mathematics (470), though higher than the 12 percent taught by teachers with other majors (462). Almost all of the eighth grade students were taught mathematics by teachers with college degrees (except in Morocco).

## Teachers' Years of Experience

It is difficult to examine the effects of teacher experience on student achievement, because sometimes more experienced teachers are assigned to students of higher ability and fewer discipline problems, and other times the more experienced teachers are assigned to the lower-achieving students in need of more help. However, some research has addressed this selection bias problem; and experience can have a large positive impact primarily in the first few years of teaching, although the benefits can continue beyond the first five years of a teacher's career (Harris \& Sass, 2011; Leigh, 2010).

Exhibit 7.5 presents teachers' reports about their years of experience for participants in the TIMSS fourth grade assessment. On average across the fourth grade countries, teachers of mathematics had been teaching for an average of 17 years. Forty-one percent of the students, on average, had very experienced teachers with 20 years or more of experience, and another 30 percent had teachers with at least 10 (but less than 20) years of experience. Taken together, close to three-fourths of the students had very experienced teachers.

Average mathematics achievement was highest, on average, for students whose teachers had 20 or more years of experience, compared to those whose teachers had between 10 and 20 years of experience or students with even less experienced teachers (498 and 490 vs. 486, respectively). This achievement gap could be a reflection of more senior teachers receiving preferred assignments, although at the fourth grade there is relatively little tracking or streaming. However, this gap also could reflect the fact that the newer teachers still are learning the most effective instructional approaches.

Exhibit 7.6 shows mathematics teachers' reports from the eighth grade assessment about their years of experience. On average, the eighth grade teachers were slightly less experienced than their fourth grade counterparts (16 years vs. 17 years), leading to lesser percentages of students taught by experienced teachers-64 percent taught by teachers with at least 10 years of experience, compared to 71 percent of fourth grade students. The relationship between teacher experience and average student achievement was more pronounced among the eighth grade students, rising from 458 points for students taught by teachers with less than 5 years of experience to 474 points for students taught by teachers with more than 20 years of experience. With more use of tracking and streaming of students by the eighth grade, this may be symptomatic of the more experienced teachers receiving preferred assignments.

## Teachers' Professional Development

Evidence from recent meta-analyses of research conducted in the United States shows that teacher professional development in mathematics has a significant positive effect on student achievement (Blank \& de las Alas, 2009) and that the amount of professional development (more than 14 hours) was an important factor (Yoon, Duncan, Lee, Scarloss, \& Shapley, 2007).

Exhibit 7.7 presents, for the fourth grade TIMSS assessment, teachers' reports about areas of professional development in mathematics in which they had participated in the past two years. Although there was a lot of variation across countries, the most common areas of mathematics professional development for teachers of fourth grade students were mathematics pedagogy/instruction, mathematics content, and mathematics curriculum. On average, 46 percent of students had teachers who had professional development in mathematics instruction or pedagogy, 44 percent had teachers taking mathematics content, and 41 percent taking mathematics curriculum. Mathematics assessment and integrating information technology into mathematics were less common areas, with 37 percent and 33 percent of students, respectively, having teachers who had participated in professional development in these areas in the past two years.

As shown in Exhibit 7.8, mathematics teachers of students in the TIMSS eighth grade assessment reported somewhat higher levels of participation in mathematics professional development. On average across the eighth grade countries, the majority of students were taught by mathematics teachers who had participated in professional development in mathematics instruction or pedagogy (58\%), content (55\%), or curriculum (52\%) in the past two years. Furthermore, almost half of the students had teachers with professional development in integrating information technology into mathematics (48\%), mathematics assessment (47\%), or improving students' critical thinking or problem solving skills (43\%).

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An" r " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An " s " indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

## Teachers' Preparation to Teach the TIMSS Mathematics Topics

Although a sound knowledge of mathematics would seem to be a prerequisite for effective mathematics teaching, evidence directly linking teacher preparation in mathematics to the achievement of their students is scarce. A meta-analysis of the effects of teachers' subject matter preparation on their students' achievement in mathematics and science found some studies showing a positive effect, but in general results were mixed (Wilson, Floden, \& Ferrini-Mundi, 2002). However, a study using a direct measure of teachers' mathematics content knowledge as a measure of teacher preparation found that teachers' mathematics content knowledge related to gains in students' mathematics achievement in primary school (Hill, Rowan, \& Ball, 2005).

To provide information about how well prepared teachers feel they are to teach mathematics, TIMSS asks the teachers of the students participating in each assessment to indicate whether they felt very well prepared, somewhat prepared, or not well prepared to teach the mathematics content topics assessed by TIMSS.

Exhibit 7.9 presents reports of how teachers felt about their level of preparation to teach the mathematics topics in the fourth grade assessment. The 18 mathematics topics are shown on the second page of the exhibit, grouped by content domain (number, geometric shapes and measures, and data display). With participants listed in alphabetical order, the exhibit presents for each participant the percentage of students taught by teachers who felt
"very well" prepared to teach the TIMSS topics. The results are averaged across all 18 topics for a perspective on mathematics overall, as well as separately by content domain: eight topics in number, seven topics in geometric shapes and measures, and three topics in data display. Internationally across the fourth grade countries, 83 percent of students were taught by teachers who felt very well prepared to teach the TIMSS mathematics topics. Across the content domains, more students had teachers very well prepared to teach the number topics $(87 \%)$ than the geometric shapes and measures topics $(82 \%)$ or the data display topics (74\%).

Exhibit 7.10 presents reports of teachers about their level of preparation to teach the 19 mathematics topics in the eighth grade assessment. Similar to the fourth grade, 84 percent of the eighth grade students, on average internationally, were taught by teachers who felt very well prepared to teach the TIMSS mathematics topics. Across the content domains, most students had teachers very well prepared to teach the number topics (92\%), with relatively fewer well prepared in algebra ( $87 \%$ ) and geometry ( $85 \%$ ) topics. Only 62 percent of students, on average internationally, had teachers who felt very well prepared to teach the data and chance topics.

TIMSS $20114^{\text {th }}$
Mathematics Grade

## TIMSS 2011 Mathematics Topics

A. Number

1) Concepts of whole numbers, including place value and ordering
2) Adding, subtracting, multiplying, and/or dividing with whole numbers
3) Concepts of fractions
4) Adding and subtracting with fractions
5) Concepts of decimals, including place value and ordering
6) Adding and subtracting with decimals
7) Number sentences
8) Number patterns

## B. Geometric Shapes and Measures

1) Lines: measuring, estimating length of; parallel and perpendicular lines
2) Comparing and drawing angles
3) Using informal coordinate systems to locate points in a plane
4) Elementary properties of common geometric shapes
5) Reflections and rotations
6) Relationships between two-dimensional and three-dimensional shapes
7) Finding and estimating areas, perimeters, and volumes

## C. Data Display

1) Reading data from tables, pictographs, bar graphs, or pie charts
2) Drawing conclusions from data displays
3) Displaying data using tables, pictographs, and bar graphs

## TIMSS 2011 Mathematics Topics

A. Number

1) Computing, estimating, or approximating with whole numbers
2) Concepts of fractions and computing with fractions
3) Concepts of decimals and computing with decimals
4) Representing, comparing, ordering, and computing with integers
5) Problem solving involving percents and proportions

## B. Algebra

1) Numeric, algebraic, and geometric patterns or sequences
2) Simplifying and evaluating algebraic expressions
3) Simple linear equations and inequalities
4) Simultaneous (two variables) equations
5) Representation of functions as ordered pairs, tables, graphs, words, or equations

## C. Geometry

1) Geometric properties of angles and geometric shapes
2) Congruent figures and similar triangles
3) Relationship between three-dimensional shapes and their two-dimensional representations
4) Using appropriate measurement formulas for perimeters, circumferences, areas, surface areas, and volumes
5) Points on the Cartesian plane
6) Translation, reflection, and rotation

## D. Data and Chance

1) Reading and displaying data using tables, pictographs, bar graphs, pie charts, and line graphs
2) Interpreting data sets
3) Judging, predicting, and determining the chances of possible outcomes

## Teachers' Confidence in Teaching Mathematics

Teachers with a strong sense of personal ability to organize and execute their teaching are more open to new ideas and less likely to experience emotional burnout. Research has shown that teachers' self-confidence in their teaching skills is not only associated with their professional behavior, but also with students' performance and motivation (Bandura, 1997; Henson, 2002).

To investigate teachers' confidence in teaching mathematics to the TIMSS class, teachers were asked to indicate how confident they feel about doing each of the following:

- Answer students' questions about mathematics;
- Show students a variety of problem solving strategies;
- Provide challenging tasks for capable students;
- Adapt my teaching to engage students' interest; and
- Help students appreciate the value of learning mathematics.

Exhibit 7.11 shows the fourth grade TIMSS assessment results for the Confidence in Teaching Mathematics scale. Students were scored according to their teachers' responses with Very Confident teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other teachers were considered to be Somewhat Confident. On average internationally, the majority of fourth grade students (75\%) had teachers Very Confident in teaching mathematics to the class, and their mathematics achievement was somewhat higher on average than the 25 percent of students whose teachers were only Somewhat Confident (492 vs. 487). Across countries, the percentage of students taught by Very Confident teachers varied widely, from 21 to 99 percent.

Exhibit 7.12 provides further information about the components of the Confidence in Teaching Mathematics scale, by showing the percentage of students whose teachers reported feeling very confident in using each of the five instructional strategies. On average across countries at the fourth grade, teachers were most often very confident about answering student questions about mathematics ( $84 \%$ of students taught by such teachers) and showing students a variety of problem solving strategies (75\%), and less often very confident about helping students appreciate the value of learning mathematics (69\%), adapting teaching to engage student interests (65\%), and providing challenging tasks for capable students (59\%).

Exhibit 7.13 shows results for the Confidence in Teaching Mathematics scale for the eighth grade TIMSS assessment. On average, the results were very similar to the fourth grade, although the achievement difference between students with Very Confident teachers and Somewhat Confident teachers was slightly larger (14 points vs. 5 points). Again, the percentage of students taught by Very Confident teachers varied widely, from 36 to 99 percent. Also, as shown in Exhibit 7.14, the components of the Confidence in Teaching Mathematics scale at the eighth grade followed a similar pattern in terms of teacher confidence as at the fourth grade, with teachers most often very confident about answering student questions about mathematics ( $87 \%$ of students taught by such teachers) and showing students a variety of problem solving strategies (77\%) and less often very confident about the other components.

Reported by Teachers
Students were scored according to their teachers' responses to how confident they felt in using five instructional strategies on the Confidence in Teaching Mathematics scale. Students with Very Confident teachers had a score on the scale of at least 9.2, which corresponds to their teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other students had Somewhat Confident teachers.

Reported by Teachers
Students were scored according to their teachers' responses to how confident they felt in using five instructional strategies on the Confidence in Teaching Mathematics scale. Students with Very Confident teachers had a score on the scale of at least 9.2, which corresponds to their teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other students had Somewhat Confident teachers.

## Centerpoint of scale set at 10 .

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement.
An " r " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An " $s$ " indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

## Teachers' Career Satisfaction

Teachers who are satisfied with their profession and the working conditions at their school are more motivated to teach and prepare their instruction. Further, having teachers that can provide leadership is a dimension of teacher quality. However, developing master teachers requires retention in the profession. Teachers need to be committed to the profession and like it enough to continue teaching. It may be that some subject areas and locales would benefit from policies to reduce teacher attrition in order to improve student achievement (Boyd, Grossman, Lankford, Loeb, \& Wyckoff, 2009).

Exhibit 7.15 shows the fourth grade TIMSS assessment results for the TIMSS 2011 Teacher Career Satisfaction scale, based on how much teachers agreed with each of the following six statements:

- I am content with my profession as a teacher;
- I am satisfied with being a teacher at this school;
- I had more enthusiasm when I began teaching than I have now (reverse coded);
- I do important work as a teacher;
- I plan to continue as a teacher for as long as I can; and,
- I am frustrated as a teacher (reverse coded).

Students were scored according to their teachers responses, with Satisfied teachers "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Internationally, on average, the majority of fourth grade students (54\%) had teachers Satisfied with their careers. Another 41 percent of the students, on average, had teachers that reported being Somewhat Satisfied (mostly agreed "a little" instead of "a lot"). Although satisfaction could be relative and dependent on the teaching situation, very few fourth grade students had mathematics teachers expressing any dissatisfaction except in a small number of countries.

The Teacher Career Satisfaction scale was positively related to average mathematics achievement. On average, mathematics achievement was higher for the fourth grade students of Satisfied teachers than for students of Somewhat Satisfied or Less Than Satisfied teachers. However, looking across the countries at the fourth grade, sixth grade, and benchmarking participants, it is clear that there are differences from country to country. In particular, it is noteworthy that four of the highest achieving countries in mathematics at the fourth gradeChinese Taipei, Singapore, Japan, and Korea-had among the lowest percentages of students taught by Satisfied teachers, but that there was no relationship between teacher satisfaction and mathematics achievement in these countries.

As shown in Exhibit 7.16, the eighth grade mathematics teachers reported somewhat lower levels of career satisfaction than the fourth grade teachers, with 47 percent of students taught by Satisfied teachers (compared to $54 \%$ at the fourth grade). However, taken together, almost all of the eighth grade students (92\%) were taught mathematics by Satisfied or Somewhat Satisfied teachers. Similar to the fourth grade situation, on average, students taught by Satisfied teachers had higher mathematics achievement than those taught by less satisfied teachers (473 vs. 464 and 462).

Reported by Teachers
Students were scored according to their teachers' degree of agreement with six statements on the Teacher Career Satisfaction scale. Students with
Satisfied teachers had a score on the scale of at least 10.1, which corresponds to their teachers "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Students with Less Than Satisfied teachers had a score no higher than 6.6 , which corresponds to their teachers "disagreeing a little" with three of the six statements and "agreeing a little" with the other three, on average. All other students had Somewhat
Satisfied teachers.

Reported by Teachers
Students were scored according to their teachers' degree of agreement with six statements on the Teacher Career Satisfaction scale. Students with Satisfied teachers had a score on the scale of at least 10.4, which corresponds to their teachers "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Students with Less Than Satisfied teachers had a score no higher than 7.0, which corresponds to their teachers "disagreeing a little" with three of the six statements and "agreeing a little" with the other three, on average. All other students had Somewhat
Satisfied teachers.

## Chapter 8

## Classroom Instruction

Overall, students with positive attitudes toward mathematics have higher achievement, but these attitudes deteriorate over time. Internationally, by the eighth grade, only about one-fourth like learning mathematics (compared to nearly half at the fourth grade) and only 14 percent are confident in their abilities (compared to one-third).

Engaging instruction as well as good nutrition and enough sleep were related to higher achievement. However, by the eighth grade, only one-quarter of the students reported being engaged in their mathematics lessons, and nearly as many reported being not engaged. Also, in the majority of eighth grade classrooms, instruction was limited because students were suffering from lack of sleep.

This chapter considers the learning environment of the classroom itself, because classroom instruction is at the core of student learning. Previous chapters of this report have described how teaching effectiveness can be greatly influenced by students' home and school environments as well as by the teacher's preparation. However, even though the curricular policies and school resources often set the tone for accomplishment, students' day-to-day classroom activities are likely to have a considerable direct impact on their mathematics learning.

TIMSS routinely presents very powerful evidence showing that, within countries, students with more positive attitudes toward mathematics have substantially higher achievement, and the results from TIMSS 2011 are consistent with previous assessments. In addition to being motivated to learn, students need the opportunity to learn. Thus, this chapter also provides information about the instructional time devoted to mathematics and the approaches teachers use to engage students in learning. It is difficult, however, for teachers to engage students in learning, for example, if students do not have the prerequisite skills or are too sleep deprived or disruptive to pay attention. Finally, an effective classroom environment for mathematics learning involves using a variety of instructional approaches, capitalizing on technology, and at the eighth grade, extending instruction with homework and regularly assessing student progress.

## Students' Attitudes Toward Mathematics

Each successive TIMSS assessment has shown a strong positive relationship within countries between student attitudes toward mathematics and their mathematics achievement. Additionally, there is extensive research showing that students with more positive attitudes toward mathematics and science have higher average achievement in mathematics and science. For example, a recent meta-analysis of student attitudes toward school found that attitudes toward mathematics or science were related to mathematics and science achievement across 288 studies (Hattie, 2009). While positive attitudes and high achievement in mathematics go hand in hand, it should be understood that the relationship is bidirectional, with attitudes and achievement mutually influencing each other. Students who are good at mathematics also are more likely to enjoy learning mathematics.

Much research about students' attitudes toward learning has studied the complex phenomenon of motivation. For example, students' motivation to learn can be affected by whether they find the subject enjoyable and place value on the
subject. In addition, students' motivation can be affected by their self-confidence in learning the subject. TIMSS 2011 included scales about three motivational constructs: intrinsic value (interest), utility value, and ability beliefs. Essentially, intrinsic motivation refers to doing an activity because it is interesting or enjoyable, and the Students Like Learning Mathematics scale was developed to measure students' interest and liking of learning mathematics. In contrast, extrinsic motivation refers to doing something because it leads to a desirable outcome. There are many types of external motivation from teacher praise, to good grades, to being accepted to a good university, to having a successful career and daily life. In particular, the TIMSS 2011 Students Value Mathematics scale addresses students' attitudes about the importance of the subject and usefulness of the subject, sometimes called attainment value and utility value (Wigfield \& Eccles, 2000). Finally, motivation to learn includes having the feeling that you can succeed. The Student Confidence with Mathematics scale assesses students' self-confidence or self-concept in their ability to learn mathematics. A strong self-concept encourages students to engage with the instruction and show persistence, effort, and attentiveness.

## Students Like Learning Mathematics

Exhibit 8.1 presents the fourth grade results for the TIMSS 2011 Students Like Learning Mathematics scale. Students were scored according to the degree of their agreement with five statements such as "I enjoy learning mathematics," "Mathematics is boring" (reverse coded), and "I learn many interesting things in mathematics" (see second page of the exhibit for details). Students in the Like Learning Mathematics category "agreed a lot" with three of the five statements and "agreed a little" with the other two, on average. In contrast, students who Do Not Like Learning Mathematics "disagreed a little" with three of the statements and "agreed a little" with the other two, on average.

For each TIMSS 2011 participant, the percentage of students in each category is shown together with the students' average mathematics achievement. The first page of the exhibit presents the results for countries participating at the fourth grade, and the average results across those countries. The second page of the exhibit presents the results for the sixth grade and benchmarking participants.

On average, nearly half of the fourth grade students internationally Like Learning Mathematics, substantially more than Do Not Like Learning Mathematics ( $48 \%$ vs. $16 \%$ ). The remaining fourth grade students ( $36 \%$, on
average) Somewhat Like Learning Mathematics. Looking across countries, some of the highest performing countries have the smallest percentages of students reporting positive attitudes toward learning mathematics, such as Chinese Taipei, Japan, and Korea. The tendency of smaller percentages of students in some East Asian countries to report positive attitudes is consistent with previous TIMSS assessments. The relatively low percentages of students who like learning mathematics may partially result from the high level of difficulty of the mathematics being studied, and also these countries have a cultural tradition of serious attitudes toward learning.

Most important, however, on average internationally, and in almost all TIMSS 2011 countries, including the sixth grade and benchmarking participants, students who liked learning mathematics had higher average mathematics achievement than those who only somewhat liked learning mathematics. In particular, those students who reported not liking learning mathematics had the lowest average mathematics achievement.

Exhibit 8.2 presents the corresponding results for the eighth grade on the Students Like Learning Mathematics scale. The first page of the exhibit presents the results for countries participating at the eighth grade, and the average results across those countries. The second page of the exhibit presents the results for the ninth grade and benchmarking participants.

Compared to the fourth grade, substantially fewer eighth grade students reported positive attitudes toward learning mathematics. By the eighth grade, more students reported an emerging dislike for learning mathematics than reported liking it, and the drop in positive attitudes between fourth and eighth grade occurred across countries. Only about one-fourth of the students, internationally, on average, Like Learning Mathematics, and another 42 percent Somewhat Like Learning Mathematics. Nearly one-third (31\%) Do Not Like Learning Mathematics. The pattern of achievement in relation to attitudes mirrored that of the younger students, with a direct relationship between the two. Increasingly, more positive attitudes toward learning mathematics were associated with progressively higher average mathematics achievement. This pattern held generally across the ninth grade and benchmarking participants.

TIMSS \& PIRLS

## Students Value Mathematics

Exhibit 8.3 presents the results for the TIMSS 2011 Students Value Mathematics scale, which only was given at the eighth grade. The scale itself addresses six different aspects of valuing mathematics:

- I think learning mathematics will help me in my daily life;
- I need mathematics to learn other school subjects;
- I need to do well in mathematics to get into the university of my choice;
- I need to do well in mathematics to get the job I want;
- I would like a job that involves using mathematics; and
- It is important to do well in mathematics.

Students with a score corresponding to "agreeing a lot" with three of the statements and "agreeing a little" with the other three, on average, were considered to Value mathematics. In comparison, students in the Do Not Value mathematics category "disagreed a little" with three of the statements and "agreed a little" with the other three, on average.

Internationally, on average, eighth grade students placed a high value on mathematics. Apparently, even though many eighth grade students do not especially enjoy learning mathematics, they do appreciate the value of the subject; forty-six percent Value mathematics and another 39 percent Somewhat Value it. Only 15 percent Do Not Value the subject. Across the eighth grade, ninth grade, and benchmarking participants, students who said they valued mathematic typically had higher achievement than students who only valued it somewhat, and those students, in turn, had higher achievement than students who did not value mathematics.

Reported by Students
Students were scored according to their degree of agreement with five statements on the Students Like Learning Mathematics scale. Students who Like Learning Mathematics had a score on the scale of at least 10.1, which corresponds to their "agreeing a lot" with three of the five statements and "agreeing a little" with the other two, on average. Students who Do Not Like Learning Mathematics had a score no higher than 8.1 , which corresponds to their "disagreeing a little" with three of the five statements and "agreeing a little" with the other two, on average. All other students Somewhat Like Learning Mathematics.

Lynch School of Education, Boston College

Reported by Students
Students were scored according to their degree of agreement with five statements on the Students Like Learning Mathematics scale. Students who Like Learning Mathematics had a score on the scale of at least 11.3, which corresponds to their "agreeing a lot" with three of the five statements and "agreeing a little" with the other two, on average. Students who Do Not Like Learning Mathematics had a score no higher than 9.0, which corresponds to their "disagreeing a little" with three of the five statements and "agreeing a little" with the other two, on average. All other students Somewhat Like Learning Mathematics.

How much do you agree with these statements about learning mathematics?

Reported by Students

| Students were scored according to their degree of agreement with six statements on the Students Value Mathematics scale. Students who Value mathematics had a score on the scale of at least 10.3, which corresponds to their "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Students who Do Not Value mathematics had a score no higher than 7.9, which corresponds to their "disagreeing a little" with three of the six statements and "agreeing a little" with the other three, on average. All other students Somewhat Value mathematics. |  |  |  |  |  |  |  |

## Centerpoint of scale set at 10 .

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least $70 \%$ but less than $85 \%$ of the students.

Reported by Students
Students were scored according to their degree of agreement with nine statements on the Students Confident in Mathematics scale. Students Confident in mathematics had a score on the scale of at least 12.0, which corresponds to their "agreeing a lot" with five of the nine statements and "agreeing a little" with the other four, on average. Students who were Not Confident had a score no higher than 9.4, which corresponds to their "disagreeing a little" with five of the nine statements and "agreeing a little" with the other four, on average. All other students were Somewhat Confident with mathematics.

## Students Confident in Mathematics

Exhibit 8.4 presents the fourth grade results for the TIMSS 2011 Students Confident in Mathematics scale, which includes seven such statements as "Mathematics is harder for me than for many of my classmates" (reverse coded) and "My teacher tells me I am good at mathematics" (see second page of exhibit for all seven statements). Confident students "agreed a lot" with four of the seven statements and "agreed a little" to the other three, on average. Students Not Confident in mathematics "disagreed a little" with four of the statements and "agreed a little" with the other three, on average.

Internationally, on average, 34 percent of the fourth grade students expressed confidence in their mathematics ability. Average mathematics achievement was highest for the Confident fourth grade students and lowest (by 75 points) for the students lacking confidence ( $21 \%$ across countries). Looking across countries, the majority of fourth grade students were not very confident about their mathematics ability. Also, similar to the results for "liking" to learn mathematics, students in some of the highest performing countries expressed the least confidence. For the sixth grade participants, somewhat fewer students expressed confidence (18-20\%), but similar percentages expressed a lack of confidence (21-29\%).

Exhibit 8.5 presents the eighth grade results for the Students Confident in Mathematics scale, which contained nine statements. Compared to the fourth grade scale, two additional statements at the eighth grade addressed the issue of the increasing difficulty of the subject, such as "Mathematics makes me confused and nervous" (reverse coded, see the second page of the exhibit for details). Confident students had a score corresponding to "agreeing a lot" with five of the nine statements and "agreeing a little" with the other four, on average. Internationally, on average, only 14 percent of the eighth grade students expressed confidence in their mathematics ability. Primarily the students were divided equally between those expressing some confidence (45\%) and those expressing little confidence (41\%). At the eighth grade, on average, the confidence gap was particular large-104 points-between the small percentage of Confident students and those Not Confident. To at least some extent, the eighth grade results held constant across the ninth grade and benchmarking participants.

## Instructional Time

## Instructional Time Spent on Mathematics

It is difficult to examine the effect of instructional time on student achievement, because a wide variety of factors influence the productivity of instruction hours-most importantly, the quality of the curriculum and instructional approaches (and all of the variables influencing them). In addition, the relationship between instructional time and student achievement is highly dependent on the effectiveness of the educational system. If an education system essentially is ineffective, increasing the amount of instruction time will have diminishing returns. Also, most countries set levels of instructional time across their systems as a matter of policy, so that any variation is unintended and rarely related to achievement.

Despite the difficulties in studying its effects, instructional time remains a crucial resource in considering students' opportunity to learn. If everything else about schooling was equal and of high quality, more instructional time should result in increased student learning. For example, a recent study published by the London School of Economics used data from PISA 2006 and from 10- and 13-year-olds in Israel to compare achievement estimates for the same students across curriculum subjects, and found that instructional time has a positive and significant effect on achievement (Lavy, 2010).

Exhibits 8.6 and 8.7 present principals' and teachers' reports about the instructional hours per year spent on mathematics instruction, respectively, at the fourth and eighth grades. The results for the time spent on mathematics instruction were based on a series of calculations. As explained on the second page of the exhibits, principals provided the number of school days per year and the number of instructional hours per day. This information was combined to show the yearly total number of instructional hours in each country shown in the first column of the exhibit. There was substantial variation across countries, but the fourth grade students in the TIMSS 2011 countries averaged about 900 hours per year of instruction, while those in the eighth grade averaged about 1,000 hours.

Teachers reported the weekly amount of instruction in mathematics. This information was combined with the data provided by principals to estimate yearly amounts of instructional time in mathematics for each TIMSS 2011 participant (second column in the exhibits). The countries are listed in the exhibits from most to least yearly instructional time in mathematics. It should be emphasized that at both the fourth and eighth grades, including the sixth

and ninth grades, and the benchmarking participants, there was considerable variation across countries in the amount of time provided for mathematics instruction. Countries spend different amounts of time on total schooling, and allocate different amounts of the total time to mathematics instruction. Also, some countries are more efficient than others. Providing time for instruction is a necessary but not sufficient condition for student learning. The time allocated for instruction is a resource that needs to be used effectively, and efficiently.

## Students Taught the TIMSS Mathematics Topics

The mathematics content and topic areas assessed in TIMSS 2011 are elaborated in the Mathematics Framework, with each topic area for the fourth and eighth grades presented as comprehensive lists of objectives. Developed collaboratively by the participating countries, the TIMSS topics do not represent the "least common denominator" but rather a forward-looking conception of mathematics teaching and learning.

Exhibit 8.8 presents teachers' reports about the TIMSS mathematics topics that actually had been taught to students in fourth grade classrooms either prior to or during the year of the assessment. The exhibit shows, for each TIMSS participant, the percentage of students whose teachers reported that the students had been taught each of the topics, averaged across all mathematics topics and across all topics within each mathematics content domain. The topics are shown on the second page of the exhibit. At the fourth grade, teachers were asked about a total of 18 topics, including eight in number, seven in geometric shapes and measures, and three in data and chance.

At the fourth grade, according to their teachers, 72 percent of students, on average, had been taught the TIMSS mathematics topics overall. There was considerable variation across countries, from 93 percent in Northern Ireland to 47 percent in Morocco. On average, the percentage of students taught various topics was similar across the three content domains, although somewhat lower for geometric shapes and measures (65\%) than for both number and for data display (76\%). In general, these patterns also were found at the sixth grade and for the benchmarking participants. However, including the fourth grade, there was considerable variation from topic to topic and from participant to participant.

Exhibit 8.9 presents teachers' reports about the TIMSS mathematics topics that actually had been taught to students in eighth grade mathematics classrooms either prior to or during the year of the assessment. The exhibit shows, for each TIMSS participant, the percentage of students whose teachers
reported that the students had been taught each of the topics, averaged across all mathematics topics and across all topics within each mathematics content domain. The topics are shown on the second page of the exhibit. At the eighth grade, teachers were asked about a total of 19 topics, including five in number, five in algebra, six in geometry, and three in data and chance.

At the eighth grade, on average, 80 percent of students had been taught the mathematics topics overall. Teachers' reports about the degree of implementation ranged from 95 percent in Macedonia and Romania to 52 percent in Norway. Almost all of the students, 98 percent, on average, had been taught the number topics by the eighth grade. The coverage for algebra and geometry was similar, with 75 percent of the students being taught the topics in each of those two content areas. The least instructional attention was given to the topics in data and chance, with 66 percent of students taught the topics in this domain, on average. It should be emphasized that there was considerable variation across countries, particularly in the percentages of students taught the data and chance topics. Also, although these patterns were similar for the benchmarking participants, according to their teachers smaller percentages of ninth grade students had been taught the topics, especially in Honduras.

National Research Coordinators were asked to indicate whether each of the TIMSS 2011 mathematics topics was included in their countries' intended curriculum through the fourth or eighth grade, and if so, whether the topics were intended to be taught to "all or almost all students" or "only the more able students." The results for the fourth and eighth grades are summarized in Exhibits 8.10 and 8.11. On average, across countries, the majority of the assessment topics were intended for all students-13 out of 18 at the fourth grade, and 16 out of 19 at the eighth grade.

At the fourth grade, the results varied topic by topic and country by country. However, of the eight number topics, on average, six were included in the curriculum and two were not; of the seven geometry topics, five were included and two were not; and of the three data display topics, two were included and one was not. At the eighth grade, there was also considerable variation across countries. However, on average, all five of the number topics were covered. In algebra, of the five topics, on average, four were included and one was not; and of the six geometry topics, five were included and one was not. In data and chance, approximately three-fourths of the countries appear to include this area in their curriculum and cover all three topics. On the other hand, Georgia, Indonesia, and the Ukraine did not include any of the data and chance topics in their curriculum.

## TIMSS 2011 Mathematics Topics

A. Number

1) Concepts of whole numbers, including place value and ordering
2) Adding, subtracting, multiplying, and/or dividing with whole numbers
3) Concepts of fractions
4) Adding and subtracting with fractions
5) Concepts of decimals, including place value and ordering
6) Adding and subtracting with decimals
7) Number sentences
8) Number patterns

## B. Geometric Shapes and Measures

1) Lines: measuring, estimating length of; parallel and perpendicular lines
2) Comparing and drawing angles
3) Using informal coordinate systems to locate points in a plane
4) Elementary properties of common geometric shapes
5) Reflections and rotations
6) Relationships between two-dimensional and three-dimensional shapes
7) Finding and estimating areas, perimeters, and volumes

## C. Data Display

1) Reading data from tables, pictographs, bar graphs, or pie charts
2) Drawing conclusions from data displays
3) Displaying data using tables, pictographs, and bar graphs

* Percentage mostly taught before or in the assessment year averaged across topics.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (-) indicates comparable data not available.
$A n$ " $r$ " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An " $s$ " indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

## TIMSS 2011 Mathematics Topics

## A. Number

1) Computing, estimating, or approximating with whole numbers
2) Concepts of fractions and computing with fractions
3) Concepts of decimals and computing with decimals
4) Representing, comparing, ordering, and computing with integers
5) Problem solving involving percents and proportions
B. Algebra
6) Numeric, algebraic, and geometric patterns or sequences
7) Simplifying and evaluating algebraic expressions
8) Simple linear equations and inequalities
9) Simultaneous (two variables) equations
10) Representation of functions as ordered pairs, tables, graphs, words, or equations

## C. Geometry

1) Geometric properties of angles and geometric shapes
2) Congruent figures and similar triangles
3) Relationship between three-dimensional shapes and their two-dimensional representations
4) Using appropriate measurement formulas for perimeters, circumferences, areas, surface areas, and volumes
5) Points on the Cartesian plane
6) Translation, reflection, and rotation

## D. Data and Chance

1) Reading and displaying data using tables, pictographs, bar graphs, pie charts, and line graphs
2) Interpreting data sets
3) Judging, predicting, and determining the chances of possible outcomes

## Collaborate to Improve Teaching

Part of creating a school learning environment focused on academic success involves a staff that collaborates on curricular activities. For example, a study including a comprehensive theoretical review and a meta-analysis of studies about professional communities indicated a small but positive effect of professional communities on student achievement (Lomos, Roelande, \& Bosker, 2011). Because teacher collaboration with colleagues is important in building a professional community, TIMSS 2011 included the Collaborate to Improve Teaching scale. Although the idea of teacher collegiality and collaboration can involve a variety of theoretical perspectives and terms, the TIMSS 2011 scale was designed to focus on the idea of collaboration for the purpose of improving teaching. Therefore, the scale was based on how often teachers interacted with other teachers regarding each of five areas:

- Discuss how to teach a particular topic;
- Collaborate in planning and preparing instructional materials;
- Share what I have learned about my teaching experiences;
- Visit another classroom to learn more about teaching; and
- Work together to try out new ideas.

Students were scored according to their teachers responses, with Very Collaborative teachers having interactions with other teachers at least "one to three times per week" in each of three of the five areas and "two or three times per month" in each of the other two, on average.

Exhibit 8.12 presents the results for the fourth grade. In general, most mathematics teachers of fourth grade students reported a high degree of collaboration with other teachers with the goal of improving teaching and learning. Internationally, on average, about one-third of the fourth grade students (36\%) had Very Collaborative teachers. Another 53 percent of students, on average, had teachers that reported being Collaborative (e.g., interacting two or three times a month for all areas). Few fourth grade students ( $11 \%$, on average) had mathematics teachers that were only Somewhat Collaborative (e.g., never or almost never interacting in three of the five areas).

Looking across countries at the fourth and sixth grades as well as the benchmarking participants, it is clear that there are differences from country to country. However, primarily these differences were between the percentages
of students with Very Collaborative and Collaborative teachers, and they had very similar achievement, on average (493 and 491, respectively).

Exhibit 8.13 presents the teacher collaboration results for the eighth grade. The mathematics teachers of eighth grade students reported a degree of collaboration with other teachers comparable to their colleagues at the fourth grade. More than one-quarter of the eighth grade students (28\%) had Very Collaborative teachers and another 57 percent had Collaborative teachers, with 15 percent having only Somewhat Collaborative teachers. Just like at the fourth grade, the eighth grade students had essentially the same average mathematics achievement whether their teachers were Very Collaborative or Collaborative (467 and 468, respectively). In general, the ninth grade and benchmarking students also had teachers that reported a considerable amount of collaboration with other teachers. According to TIMSS 2011 reports from mathematics teachers, almost all students have the benefit of teachers who collaborate with other teachers to improve instruction.

## Instruction to Engage Students in Learning

Historically, educational studies, including TIMSS, have struggled to link student achievement to instructional activities. Typically, teachers are asked to report how frequently they use various instruction activities and strategies, and such information can be very useful. However, in light of the growing body of evidence about the complexities of teaching and learning, researchers are beginning to understand these lists of activities cannot be used as proxies for the characteristics of good teaching.

To help build a better bridge between curriculum and instruction, TIMSS 2011 collected information about the concept of student content engagement as described by McLaughlin et al. (2005). According to this work, supported by the US National Center for Education Statistics, student content engagement focuses on the importance of the activity that brings the student and the subject matter content together. Engagement refers to the cognitive interaction between the student and instructional content, and may take the form of listening to the teacher or providing an explanation of a problem solution. It is the student's in-the-moment cognitive interaction with instructional content.

To measure aspects of student content engagement, TIMSS 2011 developed both a teacher scale, called the Engaging Students in Learning scale, and a student scale called the Engaged in Mathematics Lessons scale.

Exhibit 8.14 presents the fourth grade results for the Engaging Students in Learning scale. The scale contains six items related to teachers' instructional practices intended to interest students and reinforce learning:

- Summarizing the lesson's learning goals;
- Relating the lesson to students' daily lives;
- Questioning to elicit reasons and explanations;
- Encouraging students to show improvement;
- Praising students for good effort; and
- Bringing interesting materials to class.

Students were categorized according to their teachers' responses, with Most Lessons corresponding to teachers who used three of the six practices in "every or almost every lesson" and the other three in "about half the lessons," on average.

Many fourth grade students, 69 percent on average, internationally, had mathematics teachers that made efforts to engage them in instruction by using a variety of strategies in Most Lessons, and most of the remaining students had teachers that used engaging instructional practices in About Half the Lessons (with a few exceptions). Across the fourth grade, sixth grade, and benchmarking participants, students often had slightly higher average mathematics achievement if their teachers used engaging instruction in Most Lessons rather than About Half the Lessons.

Exhibit 8.15 presents the eighth grade results based on a somewhat shorter Engaging Students in Learning scale. At the eighth grade, two items were removed from the scale because relatively small percentages of students had teachers that frequently related lessons to students' daily lives, and even smaller percentages had teachers that routinely brought interesting materials to class (see exhibit 8.16). Perhaps eighth grade teachers should make greater efforts to make mathematics relevant to students' daily lives and provide interesting materials, especially in light of the drop by the eighth grade in students' liking mathematics learning. On the other hand, teachers in some of the highest achieving countries reported the least use of these instructional practices.

Based on the shorter four-item scale, on average, 80 percent of the eighth grade students had teachers that reported using engaging practices in most lessons, and almost all of the rest had teachers that reported using engaging practices in about half of the lessons. Across the eighth grade, ninth grade,

Reported by Teachers
Students were scored according to their teachers' responses to how often they interacted with other teachers in each of five teaching areas on the
Collaborate to Improve Teaching scale. Students with Very Collaborative teachers had a score on the scale of at least 11.0 which corresponds to their
teachers having interactions with other teachers at least "one to three times per week" in each of three of the five areas and "two or three times per
month" in each of the other two, on average. Students with Somewhat Collaborative teachers had a score no higher than 7.3 , which corresponds to their
teachers interacting with other teachers "never or almost never" in each of three of the five areas and "two or three times per month" in each of the other
two, on average. All other students had Collaborative teachers.

Reported by Teachers
Students were scored according to their teachers' responses to how often they interacted with other teachers in each of five teaching areas on the Collaborate to Improve Teaching scale. Students with Very Collaborative teachers had a score on the scale of at least 11.4, which corresponds to their teachers having interactions with other teachers at least "one to three times per week" in each of three of the five areas and "two or three times per month" in each of the other two, on average. Students with Somewhat Collaborative teachers had a score no higher than 7.5, which corresponds to their teachers interacting with other teachers "never or almost never" in each of three of the five areas and "two or three times per month" in the other two, on average. All other students had Collaborative teachers.

Reported by Teachers
Students were scored according to their teachers' responses to how often they used each of six instructional practices on the Engaging Students in Learning scale. Students with teachers who used engagement practices in Most Lessons had a score on the scale of at least 9.1, which corresponds to their teachers using three of the six practices "every or almost every lesson" and using the other three in "about half the lessons," on average. Students with teachers who used engagement practices in Some Lessons had a score no higher than 6.0, which corresponds to their teachers using three of the six practices in "some lessons" and using the other three in "about half the lessons," on average. All other students had teachers who used engagement practices in About Half the Lessons.

Reported by Teachers
Students were scored according to their teachers' responses to how often they used each of four instructional practices on the Engaging Students in Learning scale. Students with teachers who used engagement practices in Most Lessons had a score on the scale of at least 8.7, which corresponds to their teachers using two of the four practices "every or almost every lesson" and using the other two in "about half the lessons," on average. Students with teachers who used engagement practices in Some Lessons had a score no higher than 5.7, which corresponds to their teachers using two of the four practices in "some lessons" and using the other two in "about half the lessons," on average. All other students had teachers who used engagement practices in About Half the Lessons.

Reported by Students
Students were scored according to their degree of agreement with five statements on the Engaged in Mathematics Lessons scale. Students Engaged in mathematics lessons had a score on the scale of at least 10.2, which corresponds to their "agreeing a lot" with three of the five statements and "agreeing a little" with the other two, on average. Students who were Not Engaged had a score no higher than 7.4, which corresponds to their "disagreeing a little" with three of the five statements and "agreeing a little" with the other two, on average. All other students were Somewhat Engaged in mathematics lessons.

Reported by Students
Students were scored according to their degree of agreement with five statements on the Engaged in Mathematics Lessons scale. Students Engaged in mathematics lessons had a score on the scale of at least 11.4, which corresponds to their "agreeing a lot" with three of the five statements and "agreeing a little" with the other two, on average. Students who were Not Engaged had a score no higher than 8.3, which corresponds to their "disagreeing a little" with three of the five statements and "agreeing a little" with the other two, on average. All other students were Somewhat Engaged in mathematics lessons.

and benchmarking participants, students often had somewhat higher average mathematics achievement if their teachers used engaging instruction in Most Lessons rather than About Half the Lessons.

Exhibits 8.17 and 8.18 present the results for the TIMSS 2011 Engaged in Mathematics Lessons scale that looks at engagement from the student perspective. This scale asks how much students agree with the following five statements:

- I know what my teacher expects me to do;
- I think of things not related to the lesson (reverse coded);
- My teacher is easy to understand;
- I am interested in what my teacher says; and
- My teacher gives me interesting things to do.

Students considered to be Engaged "agreed a lot" with three of the statements and "agreed a little" with the other two, on average, whereas students in the Not Engaged category "agreed a little" with two statements and "disagreed a little" with the other three, on average. All other students were considered to be Somewhat Engaged.

At the fourth grade, internationally, on average, 42 percent of the fourth grade students reported being Engaged during their mathematics lessons, another 49 percent reported being Somewhat Engaged, and only 8 percent reported being Not Engaged. Across the fourth grade, sixth grade, and benchmarking participants, there was a positive relationship between students' reports about being more engaged and average mathematics achievement. Engaged students had higher achievement than their counterparts who reported being only Somewhat Engaged, and students Not Engaged had the lowest achievement ( 507 vs. 482 and 464, respectively).

At the eighth grade, internationally, on average, smaller percentages of students than at the fourth grade reported being engaged in their mathematics lessons. Only 25 percent of eighth grade students, on average, reported being Engaged during their mathematics lessons. The majority (54\%) reported being Somewhat Engaged and 21 percent reported being Not Engaged. In general, across the eighth grade, ninth grade, and benchmarking participants, there was a direct relationship between student engagement and average mathematics achievement-the more engaged students reported being, the higher their average mathematics achievement.

## Students Ready to Learn

## Instruction Limited by Students Lacking Prerequisite Knowledge or Skills

The characteristics of the students themselves can be very important to the classroom atmosphere. To begin, students need the prerequisite mathematics skills before they can make gains in achievement. Because prior knowledge guides learning, effective mathematics teachers assess students' knowledge, skills, and conceptual understanding, and link new ideas, skills, and competencies to prior understandings. Lack of prerequisite knowledge and skills are psychological barriers to further mathematics learning, because it is well known that students' new learning depends on that prior knowledge: "Every new thing that a person learns must be attached to what the person already knows" (McLaughlin et al., 2005, p. 5).

Exhibit 8.19 presents teachers' reports at the fourth grade about whether their mathematics instruction was limited by students lacking prerequisite knowledge or skills. On average, internationally, 27 percent of the fourth grade students were in classes where students had the necessary prerequisite skills for mathematics instruction to proceed according to teachers' plans, and 61 percent were in classes where instruction was limited to some extent. It is consistent with teachers' reports that the students in classes where instruction was progressing unimpeded had higher average mathematics achievement than did their counterparts in classes where instruction was limited to some extent ( 506 vs. 489). Also consistent with teachers' reports, average mathematics achievement was substantially lower (467) for the fourth grade students in classrooms where instruction was limited "a lot" because students lacked the prerequisite knowledge or skills. This overall pattern also was evidenced at sixth grade and for the benchmarking participants.

Exhibit 8.20 presents teachers' reports at the eighth grade about whether their mathematics instruction was limited by students lacking prerequisite knowledge or skills. On average, internationally, only 15 percent of the eighth grade students were in classes where students had the necessary prerequisite skills for mathematics instruction to proceed according to teachers' plans. According to their teachers, 57 percent were in classes where instruction was limited to some extent and 28 percent in classes where instruction was limited "a lot." As students progress through school, the curriculum becomes increasingly advanced and, not surprisingly, greater percentages of students fall behind, which typically results in some differentiation in instruction for different groups of students. Especially, taking into account some type of tailored curriculum

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde ( $\sim$ ) indicates insufficient data to report achievement.
An " r " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students. An "s" indicates data are available for at least $50 \%$ but less than $70 \%$ of the students.

and instruction for groups of students, it is distressing that, according to their teachers, relatively few students at the eighth grade are receiving the full instructional benefit that could be provided.

Eighth grade students in classes where instruction was not limited had higher average mathematics achievement than did their counterparts in classes where instruction was limited to some extent (490 vs. 471). Also consistent with teachers' reports, average mathematics achievement was substantially lower (443) for the eighth grade students in classrooms where instruction was limited "a lot" because students lacked the prerequisite knowledge or skills. This pattern also was evidenced at the ninth grade and for the benchmarking participants.

## Instruction Limited by Students Suffering from Lack of Nutrition or Sleep

The importance of a healthy breakfast is widely advertised, including the benefit of doing better in school. Unfortunately, some children in many countries around the world suffer from hunger, and a growing body of research, mostly in developing countries, is providing evidence that malnutrition has a negative impact on educational achievement. Similarly, a number of studies in a variety of countries have shown sleep duration and quality to be related to academic functioning at school. For example, a Dutch researcher found that chronic sleep reduction can affect school achievement directly and indirectly via motivation and engagement (Meijer, 2008).

Exhibit 8.21 presents teachers' reports at the fourth grade about the degree to which their mathematics instruction was limited by students' lack of nutrition or not having enough sleep. On average, internationally, 71 percent of the fourth grade students were in classrooms where instruction was "not at all" limited because students were lacking in basic nutrition. These fourth grade students had higher average mathematics achievement than their peers in classrooms where instruction was limited "some" or "a lot" due to lack of basic nutrition ( 498 vs. 472 ). It is of considerable concern that 29 percent of fourth grade students, on average, were reported to be suffering from lack of basic nutrition; and this percentage is much higher in some countries, including those that participated at the sixth grade.

Teachers reported that 53 percent of the fourth grade students, on average, were in classrooms where instruction was "not at all" limited by students suffering from not enough sleep. However, it is unfortunate that 47 percent, on average, were in classrooms where instruction was limited "some" or "a lot" by students suffering from lack of sleep. The achievement gap for sleep

TIMSS \& PIRLS
deprivation was somewhat less than that related to lack of nutrition, but the fourth grade students suffering from some amount of sleep deprivation did have lower average mathematics achievement than their more alert counterparts (by 11 points on average). Again, there was considerable variation across countries in teachers' reports about the percentages of fourth grade students suffering from not enough sleep. According to their teachers, in a number of TIMSS 2011 countries and benchmarking participants, the majority of students were at least somewhat sleep deprived.

Exhibit 8.22 presents the eighth grade teachers' reports about the degree to which their instruction was limited by students' lack of nutrition or not having enough sleep. On average, internationally, 63 percent of the eighth grade students were in classrooms where instruction was "not at all" limited because students were lacking in basic nutrition. These eighth grade students had higher average mathematics achievement than their peers in classrooms where instruction was limited "some" or "a lot" due to lack of basic nutrition ( 477 vs. 449). More than one-third (37\%) of the eighth grade students, on average, were reported to be suffering from lack of basic nutrition; and this percentage was much higher in some countries, including those that participated at the ninth grade.

Teachers reported that 43 percent of the eighth grade students, on average, were in classrooms where instruction was "not at all" limited by students suffering from not enough sleep. However, again, it is a matter of considerable concern that the majority of eighth grade students (57\%), on average, were in classrooms where instruction was limited "some" or "a lot" by students suffering from lack of sleep. Similar to the results at the fourth grade, the achievement gap for sleep deprivation was somewhat less than that related to lack of nutrition, but the eighth grade students suffering from some amount of sleep deprivation did have lower average mathematics achievement than their counterparts (by 16 points). Again, there was considerable variation across countries in teachers' reports about the percentages of eighth grade students suffering from not enough sleep. According to their teachers, however, in a number of TIMSS 2011 countries and benchmarking participants, at least two-thirds of students were at least somewhat sleep deprived.

( ) Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.
A tilde ( $\sim$ ) indicates insufficient data to report achievement
An " $r$ " indicates data are available for at least $70 \%$ but less than $85 \%$ of the students.

## Instruction Limited by Disruptive or Uninterested Students

The importance of classroom management and maintaining a positive and productive classroom environment is widely recognized as central to highquality teaching (Bill \& Melinda Gates Foundation, 2010). Yet, even the most experienced and effective teachers can encounter discipline problems.

Exhibit 8.23 presents teachers' reports about the extent to which their fourth grade classroom instruction in mathematics was limited by disruptive or uninterested students. As good news, internationally, on average, teachers reported their instruction was rarely limited by either disruptive or bored students, with 87 to 89 percent of the fourth grade students in classrooms with some or no problems. However, the 11 to 13 percent of students in classrooms with a lot of student behavior problems did have lower average mathematics achievement (from 14-26 points). Across the fourth grade, sixth grade, and benchmarking participants there was some variation in teachers' reports. In general, however, teachers reported that fourth grade students around the world appear relatively well behaved and attentive during their mathematics lessons.

Exhibit 8.24 presents teachers' reports about the extent to which their eighth grade classroom instruction in mathematics was limited by disruptive or uninterested students. Internationally, on average, teachers reported their instruction was limited "some or not at all" by disruptive students for 83 percent of the students and by bored students for 76 percent of the students. Although most eighth grade students were in mathematics classrooms with attentive students, the 17 to 24 percent of students in classrooms with "a lot" of student behavior problems had lower average mathematics achievement (from 28-34 points). Across the eighth grade, ninth grade, and benchmarking participants there was some variation in teachers' reports. Compared to the fourth grade, however, boredom appears to be an emerging problem in mathematics classes at the eighth grade. It is difficult to know whether students are bored because they cannot do the mathematics, or whether they just find mathematics boring.

TIMSS \& PIRLS

## Classroom Resources and Activities for Teaching Mathematics

## Resources Teachers Use for Teaching Mathematics

Exhibit 8.25 contains teachers' reports about the classroom materials used for teaching mathematics at the fourth grade. On average, internationally, textbooks were used most often as the basis for mathematics instruction, for 75 percent of the fourth grade students, and workbooks or worksheets were used the next most often, for 46 percent of the students. Concrete objects to help students understand quantities or procedures (often called manipulables) were used as the basis of instruction for 37 percent of the fourth grade students, and relying on computer software was relatively rare, used for only 9 percent of the students, on average. Teachers reported that all of the materials TIMSS asked about were used to some extent as a supplementary resources for mathematics instruction at the fourth grade, with concrete objects or materials the most popular, used with 62 percent of the students, on average, followed by workbooks or worksheets used with 53 percent of the students. Teachers reported using computer software as a supplementary resource for 56 percent of the fourth grade students, on average.

As shown in Exhibit 8.26, textbooks also were the most frequent basis of mathematics instruction at the eighth grade, used with 77 percent of the students internationally, on average. However, in contrast to the fourth grade, workbooks or worksheets were much less frequently reported as a basis for instruction, used with approximately one-third of eighth grade students. As would be anticipated, concrete objects were less frequently used than at the fourth grade ( $23 \%$ of students on average). Computer software was not used with many students, on average, only 7 percent. All of the following materials except textbooks were popular as supplementary instructional resources at the eighth grade: workbooks or worksheets with 62 percent of students, concrete objects with 71 percent, and computer software with 55 percent.

## Teacher Instructional Activities in Mathematics Class

There are a myriad of instructional approaches that can be used in teaching mathematics. However, effective instructional approaches often involve helping students improve their problem solving skills (a goal highlighted by the US National Council for Teachers of Mathematics (NCTM)). Also, collaborative problem solving activities have been found to be beneficial from several perspectives. For example, students in groups can discuss the merits of different proposed solutions and learn multiple strategies. Also, because they can help each other, students in groups can often handle challenging situations beyond the capabilities of individuals.

Exhibit 8.27 presents teachers' reports at the fourth grade about how much they use several common instructional approaches for teaching mathematics. The exhibit provides the percentage of fourth grade students asked to do the activity in "Every or Almost Every Lesson." Internationally, on average, the majority of fourth grade students (55\%) are asked to work problems with teacher guidance (individually or in groups) in almost every mathematics lesson. It is relatively rare for teachers to ask students ( $16 \%$ on average) to work problems without teacher guidance (individually or in groups); more common is working problems as part of whole class instruction directed by the teacher, used with 45 percent of the students in almost every lesson. The two strategies queried were: asking students to memorize rules, procedures, and facts; and asking students to explain their answers. On average, internationally, 62 percent of the students were asked for explanations in almost every lesson, whereas fewer (37\%) were asked to memorize. Looking across the countries at the fourth grade and sixth grade, as well as the benchmarking participants, there was considerable variation, in particular, for guided problem solving and memorization.

Exhibit 8.28 presents teachers reports about instructional approaches at the eighth grade. The use of the different configurations for problem solving activities corresponds closely to that reported at fourth grade. Internationally, on average, working problems with teacher guidance (individually or in groups) occurred in almost every lesson for 55 percent of students, working problems without teacher guidance (individually or in groups) for 14 percent of students, and working problems together as a whole class with direct teacher guidance for 48 percent of students. Regarding the strategies, internationally, 60 percent of the eighth grade students were asked for explanations and 45 percent to memorize, on average. At the eighth grade, teachers also reported on asking
students to apply facts, concepts, and procedures; and just about half of the students (49\%) did application tasks in almost every lesson, on average. In general, the instructional approaches used at the ninth grade and by the benchmarking participants followed the international eighth grade pattern.

## Computer Activities During Mathematics Lessons

According to the TIMSS 2011 Encyclopedia, countries are investing in technology as a way to enhance teaching and learning. Availability of computers and other technology in the mathematics classroom can facilitate successful implementation of the curriculum. For example, as described in Contextual Framework chapter of the TIMSS 2011 Assessment Frameworks, computers and the Internet provide students ways to explore concepts in-depth, trigger enthusiasm and motivation for learning, enable students to learn at their own pace, and provide students with access to vast information sources.

Besides giving students access to the Internet, computers can serve a number of other educational purposes. While initially limited to learning drills and practice, they are now used in a variety of ways including tutorials, simulations, games, and applications. New software enables students to pose their own problems and explore and discover mathematics and scientific properties on their own. Computer software for modeling and visualization of ideas can open a whole new world to students and help them connect these ideas to their language and symbol systems. A recent study summarizing 25 meta-analyses determined that computer use in the classroom has a significant positive effect on achievement at all grade levels and in all subjects (Tamim, Bernard, Borokhovski, Abrami, \& Schmid, 2011).

Exhibit 8.29 contains teachers' reports about the prevalence and types of computer-based activities used as part of mathematics instruction at the fourth grade. The range of computer availability across countries was very large, from 5 percent of the students in Iran to 87 percent in New Zealand. Internationally, on average, less than half (42\%) of the fourth grade students had computers available during their mathematics lessons. Interestingly, average mathematics achievement was equivalent between those fourth grade students with computers available and those without computers available.

Teachers reported that 26 to 27 percent of the fourth grade students, on average, were asked to use a computer at least monthly to explore mathematics principles and concepts and to look up ideas and information. Somewhat larger percentages, about one-third, were asked to use a computer at least

monthly to practice skills and procedures. The range in computer availability across the benchmarking participants reflected the fourth grade results across countries. However, the students participating at the sixth grade had less access to computers for mathematics instruction than did the fourth grade TIMSS students, on average.

At the eighth grade, reports about computer availability and use were similar to those at the fourth grade (see Exhibit 8.30). Internationally, on average, about one-third of students had computers available during their mathematics lessons, ranging from 5 percent in Tunisia to 76 percent in Norway. Students with computers available during their lessons had slightly higher mathematics achievement than students without computers available. Approximately, 21 to 24 percent of the eighth grade students were asked to do the following on at least a monthly basis: explore mathematics principles and concepts, look up ideas and information, process and analyze data, and practice skills and procedures. As would be anticipated, computer use varied considerably across countries at the eighth grade, as well as for the benchmarking participants. Countries participating at the ninth grade had less computer availability, including South Africa, Botswana, and Honduras.

## Mathematics Homework

Homework is a way to extend instruction and assess student progress. TIMSS has consistently shown that the amount of homework assigned for mathematics and science varies both within and across countries. In some situations, homework is assigned typically to students who need it the most to keep up with their classmates. In other situations, students receive homework for practice or as an enrichment exercise. Because of the different approaches and policies associated with assigning homework, it generally shows mixed results in relation to average student achievement.

The eighth grade students in TIMSS were asked how often their teacher gives homework in mathematics and how much time they usually spend on it when it is given. Weekly time on mathematics homework was estimated by multiplying the frequency of assignment by the amount of time spent. Exhibit 8.31 presents the results, with countries ordered by the percentage of students reporting they spent 3 hours or more per week. The range was from a high of 44 percent of students in Romania to 1 percent in England. It should be mentioned that although students in several of the high-performing East Asian countries report relatively small amounts of homework, many of them attend special tutoring schools. On average, internationally, only 15 percent of
the eighth grade students reported doing as much as 3 hours of mathematics homework per week. In fact, almost half (48\%) reported doing 45 minutes or less of weekly mathematics homework. Thirty-eight percent reported doing more than 45 minutes but less than 3 hours, and these students had the highest average mathematics achievement. The ninth grade and benchmarking participants had comparably smaller percentages of students reporting 3 hours or more of mathematics homework per week, although the percentages reporting less than 3 hours of weekly homework were more similar to the international averages at eighth grade.

## Mathematics Classroom Assessment

Teachers have a number of informal and formal ways to evaluate student learning. Informal assessments during instruction help teachers identify the needs of particular individuals, gauge the pace of instruction, and signal the need to adapt or reteach. Formal tests typically are used to make important decisions about the students, such as grades or marks.

Exhibit 8.32 presents teachers' reports about how often they give eighth grade students mathematics tests or examinations. Internationally, on average, eighth grade students are tested regularly in mathematics-45 percent at least every two weeks and 40 percent about monthly. Only 15 percent were tested less often, approximately a few times a year, on average. Teachers in the highperforming countries of Chinese Taipei and the Russian Federation tested almost all of the eighth grade students (97-98\%) at least every two weeks, although students in other high-performing countries were tested less often.

The exhibit also contains teachers' reports about the types of questions they included in their tests and examinations. Most frequently, the test questions involved applications of mathematical procedures. This type of question was used always or almost always for 77 percent of the students, on average, across the countries, and at least sometimes for the remaining 23 percent of the students. Test questions involving searching for patterns and relationships were used always or almost always for 31 percent of the students, on average, sometimes for 64 percent of the students, and rarely for 5 percent of the students. Test questions that required students to provide explanations or justifications for their answers were used almost always for 37 percent of students and sometimes for 56 percent, with only 8 percent almost never. However, across the eighth grade, ninth grade, and benchmarking participants, there was considerable variation in testing practices.

\text { 5) Never } & \text { 5) } 61-90 \text { minutes } \\
& \text { 6) More than } 90 \text { minutes }\end{array}
$$ <br>
The weekly time spent on mathematics homework was calculated by multiplying how often students <br>
were given homework weekly by the minutes they spent on that homework. <br>

The values for Part A were: Every day=5 ; 3 or 4 times a week=3.5 ; 1 or 2 times a week=1.5 ;\end{array}\right\}\)| Less than once a week = $0.5 ;$ and Never $=0$. |

- Indicates participation in that testing cycle.

O Indicates participation but data not comparable for measuring trends to 2011, primarily due to countries improving translations or increasing population coverage.
1 Finland assessed their fourth and eighth grade students in 2011. Also, to measure trends from their 1999 seventh grade results, Finland assessed their seventh grade students in 2011 as well.

## Appendix B

Characteristics of the Items in the TIMSS 2011<br>Mathematics Assessment

Appendix B.1: Distribution of Assessment Items by Content Domain,
TIMSS 2011
$4^{\text {th }}$ Cognitive Domain, and Item Format

## Mathematics Grade

| TIMSS Assessment Items | Multiple-choice Items | Constructed-response Items | Total Items | Percentage of Score Points |
| :---: | :---: | :---: | :---: | :---: |
| Content Domain |  |  |  |  |
| Number | 42 (42) | 46 (50) | 88 (92) | 50\% |
| Geometric Shapes and Measures | 38 (38) | 23 (27) | 61 (65) | 35\% |
| Data Display | 13 (13) | 13 (15) | 26 (28) | 15\% |
| Total | 93 (93) | 82 (92) | 175 (185) | 100\% |
| Percentage of Score Points | 50\% | 50\% |  |  |
| Cognitive Domain |  |  |  |  |
| Knowing | 43 (43) | 27 (30) | 70 (73) | 39\% |
| Applying | 34 (34) | 37 (41) | 71 (75) | 41\% |
| Reasoning | 16 (16) | 18 (21) | 34 (37) | 20\% |
| Total | 93 (93) | 82 (92) | 175 (185) | 100\% |
| Percentage of Score Points | 50\% | 50\% |  |  |

Score points are shown in parentheses.
Because of rounding some results may appear inconsistent.

## Appendix C

## Population Coverage and Sample Participation Rates

Reported by National Research Coordinators

|  | Grade 4 |  | Grade 8 |  | Information About Age of Entry, Promotion, and Retention |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Country | Country's Name for Fourth Year of Formal Schooling* | Average Age at Time of Testing | Country's Name for Eighth Year of Formal Schooling* | Average <br> Age at <br> Time of <br> Testing |  |
| Armenia | Grade 4 | 10.0 | Grade 8 | 14.6 | Children must be 6 years old to begin school the following December 31st. The age of entry policy has changed within the past ten years. Promotion is automatic for Grades $1-5$, but dependent on academic progress for Grades 6-8. |
| Australia | Year 4 | 10.0 | Year 8 | 14.0 | Varies by state, but children generally must begin school by age 6 . Most children actually begin school at the minimum age of $4.5-5$, and the age of entry policy has been revised within the past ten years. Policy on promotion and retention varies by state but, generally, there is automatic promotion for Grades 1-8. |
| Austria | Grade 4 | 10.3 |  |  | Children must begin school in the September following their 6th birthday, but parents can request early admission for children who turn 6 by March 1st of the following year. Automatic promotion for Grade 1, but there is retention in Grades $2-4$ for students failing one or more compulsory subjects. |
| Azerbaijan | Grade 4 | 10.2 |  |  | Children must be 6 years old by the end of September to begin school on September 15 of that year, but children the Ministry of Education identifies as talented who are born before the end of November can begin school in September of the year they turn 6. Promotion is automatic for Grades $1-4$, but is dependent on academic progress for Grades 5-8. |
| Bahrain | Grade 5 | 10.4 | 3rd Intermediate | 14.4 | Parents must register their children at school when they are 7 years old. Children must be 6 years old by the end of June to begin the following September. The age of entry policy has changed within the past ten years. Promotion is dependent upon passing Arabic, Mathematics, Science, and English. |
| Belgium (Flemish) | Grade 4 | 10.0 |  |  | Children must begin school on September 1st of the year of their 6th birthday. Parents can keep their child in kindergarten until age 7 , with approval. Promotion is decided by each school and/or parents; students not having fully attended preprimary education must pass a language qualification test to begin primary school. |
| Chile | Grade 4 | 10.1 | Grade 8 | 14.2 | Compulsory schooling begins at age 6. Children must be 6 years old by March 31st to begin in March of the same calendar year. Promotion is dependent on academic progress for all grades. |
| Chinese Taipei | Grade 4 | 10.2 | Grade 8 | 14.2 | Children must be 6 years old before September 1st to begin school in the September of the same calendar year. There is automatic promotion for Grades 1-8. |
| Croatia | Grade 4 | 10.7 |  |  | The age of entry policy, which has changed within the past ten years, says that all children must begin school by 7 years old. Although children must be at least 6 years old by the end of March to begin the following September, children typically begin school at age 7. Student promotion is dependent on meeting minimum standards in Grades 1-8. |
| Czech Republic | Grade 4 | 10.4 |  |  | Compulsory schooling begins at the beginning of the school year (September 1st) following the child's 6 th birthday unless granted a postponement, which an increasing number of parents are seeking. Promotion is dependent on academic progress in all compulsory subjects, but is automatic for students who have repeated a year. |
| Denmark | Grade 4 | 11.0 |  |  | Children begin preprimary education the year they turn 6 and primary education the following year. Delaying entry by a year requires municipal board approval, but parents can have their child begin a year early. This policy has changed within the past ten years. There is automatic promotion in Grades 1-8, though in special cases students may be promoted or retained based on individual assessments, with parental consent. |
| England | Year 5 | 10.2 | Year 9 | 14.2 | Children begin school the term (typically September, January, or April) of their 5th birthday. Many local authorities make provision for all children to begin in the September of the school year in which they will turn 5 and some have changed the discretionary time so that children can begin at a younger age, although all of this is subject to parental discretion. There is no policy on promotion and retention. |
| Finland | Grade 4 | 10.8 | Grade 8 | 14.8 | Children begin school the autumn of the year of their 7th birthday, although it is possible to enter school either one year earlier or one year later than the official policy, following discussions with an expert (e.g., school psychologist). There is automatic promotion for Grades 1-8, with retention only in extreme situations. |
| Georgia | Grade 4 | 10.0 | Grade 8 | 14.2 | Compulsory schooling begins at age 6 according to the Law on General Education, which has been updated within the past ten years. Promotion is automatic for Grades $1-4$, and dependent on academic progress for Grades 5-8. |
| Germany | Grade 4 | 10.4 |  |  | Compulsory schooling begins the year a child turns 6 . Children must be at least 6 years old before a statutory qualifying date (which varies by state; in most states the date falls between June 30th and September 30th) to begin on August 1st. The official policy grants parents the right to request early admission or postponed enrollment, but the school administration has the final decision. The policy on age of entry has been revised within the past ten years. There is automatic promotion in Grade 1, and promotion policies differ between states for later grades. |

[^89]|  | Grade 4 |  | Grade 8 |  | Information About Age of Entry, Promotion, and Retention |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Country | Country's Name for Fourth Year of Formal Schooling* | Average Age at Time of Testing | Country's Name for Eighth Year of Formal Schooling* | Average <br> Age at <br> Time of <br> Testing |  |
| Ghana |  |  | Junior High School Form Two | 15.8 | Children begin school the calendar year of their 6th birthday. Promotion is automatic in Grades 1-6 and dependent on academic progress for Grades 7-9. Promotion is mostly automatic in public schools. |
| Hong Kong SAR | Primary 4 | 10.1 | Secondary 2 | 14.2 | Children begin school the September after they turn 5 years, 8 months old. Representatives of the Education Bureau may prescribe a maximum rate of repetition. |
| Hungary | Grade 4 | 10.7 | Grade 8 | 14.7 | Children begin school during the calendar year they turn 6 if their birthday is before May 31st; however, children may begin during the calendar year of their 6th, 7 th, or 8 th birthday at parental request. Promotion is automatic in Grades 1-3, and dependent on academic progress for Grades 4-8. |
| Indonesia |  |  | Grade 8 | 14.3 | Children must be 7 years old by the end of June to begin on July 12th, although parents have some choice in starting children at age 6. Promotion is dependent on academic progress for Grades 1-8. |
| Iran, Islamic Rep. of | Grade 4 | 10.2 | Grade 8 | 14.3 | Children must be 6 years old by September 22nd to begin school September 23rd, although there are few private schools that allow registration at 6.5 years. Students with failing grades in June must take a cumulative exam in September to determine promotion or retention. |
| Ireland | Fourth Class | 10.3 |  |  | The Education (Welfare) Act of 2000 requires children to attend primary schools from the time that they are 6 years old but not before they are 4 . In practice, nearly half of 4 -year-olds and almost all 5 -year-olds are enrolled in infant classes in primary schools. Children only are allowed to repeat a year for educational reasons and in exceptional circumstances. |
| Israel |  |  | Grade 8 | 14.0 | The official policy is that children begin school the calendar year of their 6th birthday, but parents have the final say if they feel their children are not ready to begin. There is retention only in exceptional cases. |
| Italy | Grade 4 | 9.7 | Grade 8 | 13.8 | Children begin school the calendar year of their 6th birthday, but parents can enroll children who will turn 6 years old by April 30th of the following calendar year in the calendar year of their 5th birthday. The age of entry policy has been revised within the past ten years. Promotion is dependent on academic progress for Grades 1-8. |
| Japan | Grade 4 | 10.5 | Grade 8 | 14.5 | Compulsory schooling begins at age 6, and children must be 6 years old by April 1st to start school. There is no policy for promotion and retention. |
| Jordan |  |  | Grade 8 | 13.9 | Compulsory schooling begins at 6 years old. Children must be at least 5 years, 8 months old by September 1st to begin school. Promotion is dependent on academic progress in Arabic and mathematics for Grades $1-3$, with parental consent, and dependent on academic progress for Grades $4-8$. Students should not repeat a grade more than twice. |
| Kazakhstan | Grade 4 | 10.4 | Grade 8 | 14.6 | According to the Law of Education (2007), children must begin school at age 6, though parents can postpone enrollment for one year. The age of entry policy has changed within the past ten years. Promotion is dependent on academic progress for Grades 1-4, and dependent on successfully passing exams for Grades 5-8. |
| Korea, Rep. of | Grade 4 | 10.4 | Grade 8 | 14.3 | Children begin school during the calendar year of their 6th birthday, and must be 6 years old by the end of December to begin school in March of that year. Parents can decide to send their children a year later (at age 7), for health reasons, or a year early (at age 5). Promotion is dependent on academic progress and attendance for Grades 1-8. |
| Kuwait | Grade 4 | 9.7 |  |  | Children must be 6 years old by March 15th to begin school that calendar year, and children typically begin primary school at age 5.5 or 6 . Promotion is automatic for Grades $1-3$ and dependent on academic progress for Grades 4-8. |
| Lebanon |  |  | Grade 8 | 14.3 | Children must be 6 years old by the end of June to begin school the following September, although in public schools, special cases may be authorized by the Ministry of Education. Promotion is automatic for Grades 1-6 and dependent on academic progress for Grades 7-8. |
| Lithuania | Grade 4 | 10.7 | Grade 8 | 14.7 | Children must begin school by the calendar year of their 7th birthday, but parents can enroll children one year early if the child satisfies the requirements of the Ministry of Education and Science. The age of entry policy has been revised within the past ten years. There is no national policy on promotion and retention; decisions are made at the school level. |
| Macedonia, Rep. of |  |  | Grade 8 | 14.7 | Since 2007, children must be 6 years old by the end of December to begin school the following September. Before 2007, children had to be 6 years old by the end of May to begin school the following September. Promotion is automatic for Grades 1-5 and dependent on academic progress for Grades 6-8. |
| Malaysia |  |  | Form 2 | 14.4 | Children begin school at the beginning of January of the calendar year of their 6th birthday. There is no policy for promotion and retention. |
| Malta | Year 5 | 9.8 |  |  | Children begin school in late September of the calendar year of their 5th birthday. Students repeat a class only in exceptional circumstances in primary school and on the basis of their academic performance and other factors in exceptional circumstances in secondary school. Students can be retained only once during each education cycle. |

|  | Grade 4 |  | Grade 8 |  | Information About Age of Entry, Promotion, and Retention |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Country | Country's Name for Fourth Year of Formal Schooling* | Average <br> Age at Time of Testing | Country's Name for Eighth Year of Formal Schooling* | Average <br> Age at Time of Testing |  |
| Morocco | Grade 4 | 10.5 | Grade 8 | 14.7 | Children must be at least 5 years, 6 months old by the beginning of September to begin school, and parents rarely postpone the start. Promotion depends on academic progress for both primary and secondary grades. |
| Netherlands | Group 6 | 10.2 |  |  | Children must begin kindergarten on the first school day of the month after their 5th birthday. Most children begin kindergarten when they turn 4 and primary education at age 6 , although some children begin primary education a year later at age 7. Promotion and retention are decided by the school, dependent on academic progress. |
| New Zealand | Year 5 | 9.9 | Year 9 | 14.1 | Children must be enrolled in school by their 6th birthday but have the right to begin school at age 5 , and nearly all children begin school on or soon after their 5th birthday. There is automatic promotion, with retention only in very special circumstances with school and parental input. |
| Northern Ireland | Year 6 | 10.4 |  |  | Children must be 4 years old by July 1 st to begin school in September. The majority of children start and continue with their age group, but some transfer to post-primary a year late or early. |
| Norway | Grade 4 (4. trinn) | 9.7 | Grade 8 (8.trinn) | 13.7 | Children must begin school the calendar year of their 6th birthday. There is automatic promotion for all grades. |
| Oman | Grade 4 | 9.9 | Grade 8 | 14.1 | Children begin school the year of their 6 th birthday. Children must be at least 5 years, 9 months old at the start of the academic year (beginning of September), but parents can enroll their children in private schools where the official entry age is 5 years, 5 months. The age of entry policy has been revised within the past ten years. Promotion is automatic for Grades 1-4 and dependent on academic progress for Grades 5-8. |
| Palestinian Nat'l Auth. |  |  | Grade 8 | 13.9 | Children must be 5 years, 9 months old by the beginning of the September in which they enroll. Parents can enroll children in private schools two months earlier than public schools. Promotion is automatic for Grades 1-3 and dependent on academic progress for Grades 4-8. A maximum of $5 \%$ of students in each class may be retained. |
| Poland | Grade 3 | 9.9 |  |  | Children must begin school the calendar year of their 7th birthday, but parents can postpone the beginning of school for medical or psychological reasons. The age of entry policy has been revised within the past ten years. Parental consent is required for retention in Grades 1-6, and promotion is dependent upon academic progress in higher grades. |
| Portugal | Grade 4 | 10.0 |  |  | Children must begin school the year of their 6th birthday if they turn 6 years old by September 15th. Parents can enroll children who turn 6 years old by the end of December, depending on school availability. The age of entry policy has been revised within the past ten years. Promotion is automatic for Grade 1, and dependent on academic progress for Grades 2-8. |
| Qatar | Grade 4 | 10.0 | Grade 8 | 14.0 | Children must begin school in the September of the calendar year of their 6th birthday, but parents can enroll their children in private schools where the official entry age is 5 years, 5 months. Promotion is dependent on academic progress for Grades 1-8. |
| Romania | Grade 4 | 10.9 | Grade 8 | 14.9 | According to the law of education, which has been revised within the past ten years, children must begin school at age 6, although parents can postpone enrollment for one year. Promotion is automatic for Grade 1 , and dependent on academic progress for Grades 2-8. |
| Russian Federation | Grade 4 | 10.8 | Grade 8 | 14.7 | Children must be at least 6 years, 6 months old by the end of August to begin school in September but typically begin at age 7. Promotion is automatic for Grade 1 and dependent on academic progress for Grades 2-8. |
| Saudi Arabia | Grade 4 | 10.0 | Intermediate Year 2 | 14.1 | Children must begin school the calendar year of their 6th birthday. There is no policy on promotion and retention. |
| Serbia | Grade 4 | 10.8 |  |  | Children must begin school between the ages of 6.5 and 7.5 years old. Schools may recommend one year of continued preparatory preschool for children not considered school ready. The age of entry policy has changed within the past ten years. Promotion is automatic for Grade 1 and generally automatic for Grades 2-3, except by parental request. In Grades 4-7, students failing 2 or more subjects must pass makeup exams. |
| Singapore | Primary 4 | 10.4 | Secondary 2 | 14.4 | According to the Compulsory Education Act, children must begin school the calendar year of their 7th birthday, although parents may seek a deferral of registration based on medical grounds. There is automatic promotion for Grades 1-4; retention is at principal's discretion for Grade 5 and dependent on academic progress for Grades 6-8. |
| Slovak Republic | Grade 4 | 10.4 |  |  | Children must begin school in September if they turn 6 years old by August 31st. Children may begin school early or after an approved delay, based on psychological tests and professional recommendations. Promotion is dependent on academic progress. Students failing 1-2 required subjects must pass a makeup exam; students failing more than 2 are retained. |
| Slovenia | Grade 4 | 9.9 | Grade 8 | 13.9 | Children must begin school the calendar year of their 6th birthday, but some children who are 6 years old in January enter school in the September of the calendar year before they turn 6. The age of entry policy has been revised within the past ten years. Generally, there is automatic promotion for Grades 1-8, except for students with learning difficulties. |

|  | Grade 4 |  | Grade 8 |  | Information About Age of Entry, Promotion, and Retention |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Country | Country's Name for Fourth Year of Formal Schooling* | Average <br> Age at <br> Time of <br> Testing | Country's Name for Eighth Year of Formal Schooling* | Average <br> Age at <br> Time of <br> Testing |  |
| Spain | Primary Education Year 4 | 9.8 |  |  | Children must begin school the calendar year of their 6th birthday. Almost every child begins kindergarten at the age of 3 even though it is not compulsory. Students can be retained for 1 year during Grades 1-6, but students with special needs can be retained twice. Students that don't reach the goals in Grades 7 and 8 can be retained in both grades. |
| Sweden | Grade 4 | 10.7 | Grade 8 | 14.8 | Children begin school in the fall of the calendar year of their 7th birthday but can begin the year they turn 6 or 8 years old for special reasons. There is automatic promotion for all grades. |
| Syrian Arab Republic |  |  | Grade 8 | 13.9 | Children must begin school the September following their 6 th birthday. Promotion for Grades $1-8$ is based on academic progress, but promotion is automatic when a student fails a grade for the second time. |
| Thailand | Primary 4 | 10.5 | Middle School 2 | 14.3 | Children must begin school by the year of their 7th birthday, but can begin at the age of 6. There is no policy for promotion and retention. |
| Tunisia | Year 4 of Primary Education | 10.0 | Year 8 of Basic Education | 14.3 | Children begin school in the September of the calendar year of their 6th birthday. Younger children are accepted if there are school vacancies in the area where they live. Promotion is dependent on academic progress in Arabic, French, mathematics, and science for Grades 1-6, and dependent on academic progress for Grades 7-8. |
| Turkey | Grade 4 | 10.1 | Grade 8 | 14.0 | Children begin school in September of the calendar year of their 6th birthday, although they can begin a year later, at parental discretion. Promotion is automatic for Grades 1-3 and dependent on academic progress for Grades 4-8. |
| Ukraine |  |  | Grade 8 | 14.2 | Compulsory schooling begins at age 6. Children must be at least 6 years old by September 1st to begin school, and parents can decide if children begin school at age 6 or 7 . Retention is decided by parents, and students can take external examinations to advance into higher grade levels. |
| United Arab Emirates | Grade 4 | 9.8 | Grade 8 | 13.9 | Children can begin school when they are 5.5 years old. Parents or guardians can decide when children begin school, but it must by age 8 . The age of entry policy has been revised within the past ten years. Students in Grades 1-5 are subject to remedial instruction for promotion, and promotion in Grades 6-8 is dependent on academic achievement. |
| United States | Grade 4 | 10.2 | Grade 8 | 14.2 | Varies by state, but children commonly begin kindergarten at age 5 (by parental choice) and typically begin primary school at age 6 (by law). |
| Yemen | Grade 4 | 11.2 |  |  | Children can begin school the year of their 6th birthday, but some flexibility exists at the discretion of the school's director. Promotion is automatic for Grades $1-3$ and dependent on academic progress for Grades 4-8. |

## Out of Grade Participants

| Botswana | Standard 6 | 12.8 | Form 2 | 15.8 | Children must be 6 years old by the end of June to begin school in the January of the same calendar year, but children from remote areas may begin school later than age 6. There is up to $12.5 \%$ retention in each class and accelerated progression is possible after parent consultation. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Honduras | Grade 6 | 12.7 | Grade 9 | 15.7 | Children must be 7 years old by the end of January to begin school the following February, but about 30\% of children typically begin primary school at age 6 , per principals' decisions. Promotion is dependent on academic progress on exams prepared and administered by teachers. |
| South Africa |  |  | Grade 9 | 16.0 | Children must be 6 years old by June 30th of the year in which they enroll and children are encouraged to begin at age 7. The age of entry policy has been revised within the past ten years. In principle, students should progress with their age cohort. The norm for repetition is one year per school phase where necessary. |
| Yemen | Grade 6 | 13.2 |  |  | Children can begin school the year of their 6th birthday, but some flexibility exists at the discretion of the school's director. Promotion is automatic for Grades 1-3 and dependent on academic progress for Grades 4-8. |

## Benchmarking Participants

| Alberta, Canada | Grade 4 | 9.9 | Grade 8 | 13.9 | The law requires all children who are 6 years old by September 1 to attend school, although school boards may set their own age requirements for entering school, and many allow children to enter Grade 1 if they are 6 years old by March 1 of the following year. Parental discretion or choice is allowed. School principals make promotion decisions in line with school policies. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Ontario, Canada | Grade 4 | 9.8 | Grade 8 | 13.8 | Children must attend school in September if they turn 6 years old by September 1 but also have the right to attend school in September if they will turn 6 by December 31 of that calendar year. Parents may choose to enroll their children in junior kindergarten at age 4 or senior kindergarten at age 5 . School principals make promotion decisions, appealable to the school board. |
| Quebec, Canada | Grade 4 | 10.1 | Secondary 2 | 14.2 | Children must be 6 years old by September 30th to begin school in the September of that calendar year. School boards determine promotion and the Ministry sets rules for obtaining diplomas. |
| Abu Dhabi, UAE | Grade 4 | 9.7 | Grade 8 | 13.8 | Children must be 6 years old by 0 ctober 1st of the school year in which they enroll. Parents sometimes place students in private schools that accept younger students, then transfer them to the public system. The age of entry policy has changed within the past ten years. There is automatic promotion in Grades 1-5, except in special cases and with parental consent. Promotion is dependent on academic progress in Grades 6-8. |
| Dubai, UAE | Grade 4 | 9.8 | Grade 8 | 13.9 | Children can begin school the calendar year of their 5 th birthday. The policy on promotion and retention varies by school type. |
| Alabama, US |  |  | Grade 8 | 14.4 | According to the code of Alabama 1875 Section $16-28-3$, children must begin school at age 7 , and typically children actually do begin at age 7 . The age of entry policy has changed within the past ten years. There is no policy for promotion or retention. |
| California, US |  |  | Grade 8 | 14.1 | California law requires a child to be 6 years old on or before December 2 for the 2011-12 school year to enter Grade 1 . However, the cut-off date for entry is in the process of being moved earlier by several months (California Education Code Section 48010). Although kindergarten is not required, most parents and guardians choose to enroll their children in kindergarten. There is no policy for promotion and retention. |
| Colorado, US |  |  | Grade 8 | 14.2 | Children 6 years old on or before August 1st are required to begin school during that calendar year. Parents may opt to send their children to private or parochial schools or home school them if they choose not to meet the state policy. The age of entry policy has changed within the past ten years. Promotion and retention policies are decided by local education agencies. |
| Connecticut, US |  |  | Grade 8 | 14.1 | Children must begin school by the time they are 7 years old. A 4 -year-old may enroll in preprimary education (kindergarten) at the beginning of a school year (August or September) if he or she will turn 5 on or before January 1 of that school year. Some parents elect to delay school enrollment for younger children, and state law allows this practice provided students are enrolled in school when they are 7 years of age. Promotion and retention decisions are made locally at the district or school level. |
| Florida, US | Grade 4 | 10.4 | Grade 8 | 14.4 | Florida law (Section 1003.21 (1) (a)) specifies that children who are 6 or who will be 6 by February 1st of that school year are required to attend school. If a child enters public school at age 6 without completing kindergarten, they will be placed in kindergarten. Children who have attained the age of 5 on or before September 1 of the school year are eligible for admission to public kindergarten during that school year based on rules prescribed by the school board. Statewide, students are retained after Grade 3 if they do not pass the state reading assessment. Otherwise, policies for promotion and retention are determined by districts, based on academic performance. |
| Indiana, US |  |  | Grade 8 | 14.4 | Children are not required to be in school until the school year in which they turn 7 years old. Children must be 5 years old on or before August 1st to begin kindergarten during that calendar year. Students are retained after Grade 3 if they do not pass the state reading assessment. |
| Massachusetts, US |  |  | Grade 8 | 14.2 | Each child must attend school beginning in September of the calendar year in which he or she turns 6 . Each school committee may establish its own minimum permissible age for school attendance, provided that such age is not older than the state mandatory minimum age (established by state law 603CMR 8.00). There is no policy for promotion and retention. |
| Minnesota, US |  |  | Grade 8 | 14.3 | Compulsory schooling begins at age 7 . Children must be at least 5 years old by September 1 st to begin kindergarten, or 6 years old by September 1st to begin Grade 1 (MN Statute 120A.20). Any school board may establish a policy for admission at an earlier age. There is no policy for promotion and retention. |
| North Carolina, US | Grade 4 | 10.2 | Grade 8 | 14.2 | Compulsory schooling begins at age 7 . If the child is 5 years old on or before August 31 st the child is eligible to begin kindergarten. The statute recognizes that some students will be presented for enrollment who can be more appropriately served at a higher grade level, and it authorizes the school principal to make such decisions. There is no policy for promotion and retention. |

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as "withdrawn."
Students with a disability or language barrier that prevented them from participating in the assessment were classified as "excluded."
Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as "absent."

TIMSS guidelines for sampling participation: The minimum acceptable participation rates were $85 \%$ of both schools and students, or a combined rate (the product of school and student participation) of $75 \%$. Participants not meeting these guidelines were annotated as follows:
$\dagger$ Met guidelines for sample participation rates only after replacement schools were included.
\# Nearly satisfied guidelines for sample participation rates after replacement schools were included.
末 Did not satisfy guidelines for sample participation rates.

## Percentage of Students with Achievement Too Low for Estimation

TIMSS 2011
4 th
Mathematics Grade

| Country | Percentage of Students with Achievement Too Low for Estimation | Average Percent Correct |
| :---: | :---: | :---: |
| Armenia | 8 (0.6) | 40 (0.8) |
| Australia | 3 (0.4) | 54 (0.6) |
| Austria | 1 (0.2) | 52 (0.7) |
| Azerbaijan | 7 (0.6) | 44 (1.2) |
| Bahrain | 9 (0.6) | 37 (0.6) |
| Belgium (Flemish) | 0 (0.1) | 62 (0.5) |
| Chile | 6 (0.4) | 41 (0.5) |
| Chinese Taipei | 0 (0.1) | 71 (0.4) |
| Croatia | 3 (0.3) | 48 (0.4) |
| Czech Republic | 2 (0.3) | 52 (0.6) |
| Denmark | 1 (0.3) | 58 (0.6) |
| England | 2 (0.3) | 60 (0.8) |
| Finland | 1 (0.2) | 60 (0.6) |
| Georgia | 9 (0.6) | 40 (0.6) |
| Germany | 1 (0.2) | 57 (0.6) |
| Hong Kong SAR | 0 (0.2) | 74 (0.8) |
| Hungary | 4 (0.4) | 55 (0.7) |
| Iran, Islamic Rep. of | 11 (0.6) | 37 (0.7) |
| Ireland | 2 (0.3) | 56 (0.6) |
| Italy | 2 (0.3) | 52 (0.7) |
| Japan | 0 (0.1) | 70 (0.4) |
| Kazakhstan | 3 (0.4) | 52 (1.1) |
| Korea, Rep. of | 0 (0.1) | 74 (0.4) |
| * Kuwait | 28 (0.9) | 23 (0.4) |
| Lithuania | 1 (0.2) | 58 (0.6) |
| Malta | 4 (0.3) | 49 (0.3) |
| * Morocco | 27 (0.8) | 24 (0.6) |
| Netherlands | 0 (0.2) | 59 (0.4) |
| New Zealand | 5 (0.4) | 46 (0.5) |
| Northern Ireland | 2 (0.3) | 65 (0.6) |
| Norway | 3 (0.5) | 48 (0.7) |
| $\psi$ Oman | 19 (0.7) | 30 (0.4) |
| Poland | 4 (0.4) | 45 (0.5) |
| Portugal | 1 (0.3) | 59 (0.8) |
| Qatar | 15 (0.7) | 34 (0.6) |
| Romania | 8 (1.1) | 47 (1.2) |
| Russian Federation | 1 (0.1) | 61 (0.9) |
| Saudi Arabia | 14 (1.0) | 33 (0.9) |
| Serbia | 4 (0.4) | 54 (0.7) |
| Singapore | 1 (0.1) | 74 (0.7) |
| Slovak Republic | 3 (0.5) | 52 (0.8) |
| Slovenia | 2 (0.3) | 53 (0.5) |
| Spain | 3 (0.4) | 45 (0.6) |
| Sweden | 2 (0.3) | 50 (0.5) |
| Thailand | 6 (0.9) | 41 (1.0) |
| $\psi$ Tunisia | 25 (1.2) | 25 (0.5) |
| Turkey | 6 (0.6) | 45 (0.8) |
| United Arab Emirates | 11 (0.4) | 37 (0.4) |
| United States | 1 (0.1) | 60 (0.5) |
| * Yemen | 48 (1.6) | 16 (0.4) |

* Students were considered to have achievement too low for estimation if their performance on the assessment was no better than could be achieved by simply guessing on the multiple choice assessment items. However, such students were assigned scale scores (plausible values) by the achievement scaling procedure, despite concerns about their reliability.
* Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds $25 \%$.
$\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

## Appendix F

## The Test-Curriculum Matching Analysis-Mathematics

TIMSS went to great lengths to ensure that comparisons of student achievement across countries would be as fair and equitable as possible. The TIMSS 2011 Assessment Frameworks were designed to specify the important aspects of mathematics that participating countries agreed should be the focus of an international assessment of mathematics achievement, and the assessment items were developed through a collaborative process with national representatives to faithfully represent the specifications in the frameworks and field tested extensively in participating countries. Finalizing the TIMSS 2011 assessments involved a series of reviews by representatives of the participating countries, experts in mathematics, and testing specialists. At the end of this process, the National Research Coordinators (NRCs) from each country formally approved the TIMSS 2011 assessments, thus accepting them as being sufficiently fair to compare their students' mathematics achievement with that of students from other countries.

Although the assessments were developed to represent an agreed-upon framework and were intended to have as much in common across countries as possible, it was unavoidable that the match between the TIMSS 2011 assessment (or test) and the mathematics curriculum would not be the same in all countries. To restrict test items to just those topics included in the curricula of all participating countries and covered in the same sequence would severely limit test coverage and restrict the research questions that the study is designed to address. The tests, therefore, inevitably have some items measuring topics unfamiliar to some students in some countries.

The Test-Curriculum Matching Analysis (TCMA) was conducted to investigate the extent to which the TIMSS 2011 mathematics assessment was relevant to each country's curriculum. The TCMA also investigates the impact on a country's performance of including only achievement items that were judged to be relevant to its own curriculum. ${ }^{1}$

To gather data about the extent to which the TIMSS 2011 tests were relevant to the curricula of the TIMSS countries and benchmarking participants, NRCs were asked to examine each achievement item and indicate whether the item was in their country's intended curriculum at the grade tested (fourth or eighth grade). The NRCs were asked to choose persons very familiar with the curriculum at these grades to make this determination. In some countries, the curriculum was prescribed for a range of grades and was not explicit about what was to be covered by the end of the fourth or eighth grades. For example, in Sweden the curriculum specifies the curricular goals to be achieved by the end of

1 Because there also may be curriculum areas covered in some countries that are not covered by the TIMSS 2011 tests, the TCMA does not provide complete information about how well the tests cover the curricula of the countries.

TIMSS \& PIRLS
International Study Center Lynch School of Education, Boston College
the fifth and ninth grades, but does not provide a grade-by-grade specification. In such situations, coordinators were asked to make the best judgment possible. ${ }^{2}$ Because an item might be in the curriculum for some but not all students in a country, NRCs were asked to consider an item included if it was in the intended curriculum for more than 50 percent of the students. All TIMSS 2011 participants took part in the TCMA analysis except Bahrain, Georgia, Saudi Arabia, Honduras (sixth grade participant) and the US benchmarking states at the fourth grade, and Bahrain, Georgia, Ghana, Indonesia, Saudi Arabia, Syrian Arab Republic, Honduras (ninth grade partipant), and the US benchmarking states at the eighth grade.

Exhibits F. 1 through F. 4 present the TCMA results for the TIMSS 2011 mathematics test at fourth and eighth grades. Exhibits F. 1 and F. 2 show the average percent correct on the mathematics items judged appropriate by each country at the fourth and eighth grades, respectively. Exhibits F. 3 and F. 4 show the standard errors corresponding to the percentages presented in Exhibits F. 1 and F.2.

In Exhibit F.1, the bottom row of the exhibit shows the number of items, in terms of score points, identified as appropriate in each country. At the fourth grade, the maximum number of score points in the assessment was 184 points. ${ }^{3}$ Generally, the proportion of items judged appropriate was fairly high. Reading along the bottom row, it can be seen that two of the 47 countries that took part in the TCMA analysis judged 100 percent of the items to be included in their curricula. Another 38 countries and all of the sixth grade and benchmarking participants judged 75 percent or more ( 138 score points) to be appropriate. Only the Russian Federation judged less than half of the mathematics items to be included in their curricula.

At the eighth grade, the percentage of items judged appropriate was somewhat higher; four of the 36 countries and one of the five benchmarking participants judged 100 percent of the items to be appropriate (all 230 score points), and an additional 30 countries, two ninth grade, and four benchmarking participants judged 75 percent or more ( 173 score points) to be appropriate. For all participants, the majority of the eighth grade mathematics items were judged to be appropriate to their curricula.

Because most countries indicated that at least some items were not included in their intended curriculum at the grade tested, the data were

[^92]Based on a subset of items specifically identified by each country as addressing its curriculum
Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

International Study Center
Lynch School of Education, Boston Colleg

analyzed to determine whether the inclusion of these items had any effect on the international performance comparisons. ${ }^{4}$

The first column of data in Exhibits F. 1 and F. 2 show the average percent correct on all test items for each participant, together with its standard error. Subsequent columns show the performance of each participant on those items judged appropriate by the participant listed at the head of the column. Participants are presented in order of their performance based on average percent correct on all items, from highest to lowest. To interpret these exhibits, choosing a country and reading across its row provides the average percent correct for the students in that country on the items selected by each of the countries listed along the top of the exhibit. For example, at the fourth grade, Singapore, where the average percent correct was 75 percent on its own set of items, had 74 percent correct on the items selected by Korea and Hong Kong SAR, 75 percent on the items selected by Chinese Taipei, 74 percent on the items selected by Japan, and so forth. The column for a country listed at the top shows how each of the other participants performed on the set of items selected as appropriate for that country's students. Using the set of items selected by the England as an example, 75 percent of these items, on average, were answered correctly by students in Singapore, 74 percent by students in Korea and Hong Kong SAR, 71 percent by students in Chinese Taipei, 70 percent by students in Japan, 65 percent by those in Northern Ireland, and so forth. The shaded diagonal element in the exhibit shows how each country performed on the set of items that it selected based on its own curriculum. Thus, students from the England averaged 60 percent correct on the set of items identified by England for the analysis.

For each country's selected items, the international averages across participating countries are presented in the lower part of the exhibit. These show that the selections of items by the participating countries varied somewhat in average difficulty, ranging at the fourth grade from 49 percent correct, for those chosen by Hong Kong SAR, to 53 percent correct for those chosen by Austria. At the eighth grade, the average percent correct ranged from 43 percent, for many participants, to 47 percent for those chosen by Jordan.

Comparing the diagonal element for a country with the overall average percent correct shows the difference between performance on the set of items chosen as appropriate for that country and performance on the test as a whole. In general, countries performed better on their own item sets

[^94]than on the items overall, although not by much. To illustrate, the average percent correct for Singapore across all fourth grade mathematics items was 74 percent. The diagonal element shows that students from Singapore had a slightly greater average percent correct ( 75 percent) across the set of items selected as appropriate for Singapore than they did overall. Most participants had a difference of one or two percentage points between the two performance measures, with the largest differences in the Slovak Republic (5 percentage points). At the eighth grade, the differences were generally smaller; the largest being in Jordan and the province of Ontario (4 percentage points).

It is clear that the selection of items does not have a major effect on the relative performance among TIMSS participants. Participants that had relatively high or low performance across all the mathematics items also had relatively high or low performance on each of the various sets of items selected for the TCMA. For example, at the eighth grade, Korea had the highest average percent correct, not only on the test as a whole, but also on all of the different item selections (with some ties), with Singapore, Chinese Taipei, Hong Kong SAR and Japan next in order of performance on practically all selections of items. Although there are some changes in the ordering of countries based on the items selected for the TCMA, most of these differences are within the boundaries of sampling error. ${ }^{5}$

Even when countries performed better on the items judged by them to be included in their curriculum than they did overall, their performance relative to other participants was changed little. As an example, consider the 162 score points selected by the Slovenia at the fourth grade. The students in the Slovenia did better on these items ( $56 \%$ correct) than on the test as a whole ( $53 \%$ correct). However, most other countries also did better on these particular items, with an international average of 51 percent correct compared with 50 percent correct overall. The countries that performed better than the Slovenia on the overall test also performed as well or better on the items selected by the Slovenia.

The TCMA results provide evidence that the TIMSS 2011 mathematics assessment provides a reasonable basis for comparing achievement of the participating countries and benchmarking entities. This result is not unexpected; making the assessment as fair as possible was a major consideration in test development. The fact that the majority of countries indicated that most items were appropriate for their students means that the different average percent correct estimates were based on many of the same items. Insofar as countries

[^95]Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

* Of the 217 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 232 score points. Following item review, response categories for two of the items were combined, resulting in 230 score points.
() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent

TIMSS \& PIRLS
International Study Center
Lynch School of Education, Boston College

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

rejected items that would be difficult for their students, these items tended to be difficult for students in other countries as well. The analysis shows that omitting such items tends to improve the results for that country, but also tends to improve the results for all other countries, so that the overall pattern of relative performance is largely unaffected.

## Appendix H

## Organizations and Individuals Responsible for TIMSS 2011

## Introduction

TIMSS 2011 was a collaborative effort involving hundreds of individuals around the world. This appendix acknowledges the individuals and organizations for their contributions. Given that work on TIMSS 2011 has spanned approximately four years and has involved so many people and organizations, this list may not include all who contributed. Any omission is inadvertent. TIMSS 2011 also acknowledges the students, parents, teachers, and school principals who contributed their time and effort to the study. This report would not be possible without them.

## Management and Coordination

TIMSS is a major undertaking of IEA, and together with the Progress in International Reading Literacy Study (PIRLS) comprises the core of IEA's regular cycles of studies. The TIMSS assessment at the fourth grade complements PIRLS, which regularly assesses reading achievement at the fourth grade.

The TIMSS \& PIRLS International Study Center at Boston College has responsibility for the overall direction and management of the TIMSS and PIRLS projects. Headed by Executive Directors Drs. Ina V.S. Mullis and Michael O. Martin, the study center is located in the Lynch School of Education. In carrying out the project, the TIMSS \& PIRLS International Study Center worked closely with the IEA Secretariat in Amsterdam, which managed country participation, was responsible for verification of all translations produced by the participating countries, and coordinated the school visits by International Quality Control Monitors. The IEA Data Processing and Research Center in Hamburg was responsible for processing and verifying the data submitted by the participants; Statistics Canada in Ottawa was responsible for school and student sampling activities; and Educational Testing Service in Princeton, New Jersey consulted on psychometric methodology, provided software for scaling the achievement data, and replicated the achievement scaling for quality assurance.

The Project Management Team, comprising the study directors and representatives from the TIMSS \& PIRLS International Study Center, IEA Secretariat and IEA Data Processing and Research Center, Statistics Canada, and ETS met twice a year throughout the study to discuss the study's progress, procedures, and schedule. In addition, the study directors met with members of IEA's Technical Executive Group twice yearly to review technical issues.

To work with the international team and coordinate within-country activities, each participating country designates an individual to be the TIMSS

National Research Coordinator (NRC). The NRCs have the challenging task of implementing TIMSS in their countries in accordance with the TIMSS guidelines and procedures. In addition, the NRCs provide feedback and contributions throughout the development of the TIMSS assessment. The quality of the TIMSS assessment and data depends on the work of the NRCs and their colleagues in carrying out the complex sampling, data collection, and scoring tasks involved. Continuing the tradition of exemplary work established in previous cycles of TIMSS, the TIMSS 2011 NRCs performed their many tasks with dedication, competence, energy, and goodwill, and have been commended by the IEA Secretariat, the TIMSS \& PIRLS International Study Center, the IEA Data Processing and Research Center, and Statistics Canada for their commitment to the project and the high quality of their work.

## Funding

Funding for TIMSS 2011 was provided primarily by the participating countries. The National Center for Education Statistics of the US Department of Education was a major funding partner, providing funding under contract number ED08C00117. The content of this publication does not necessarily reflect the views or policies of the US Department of Education nor does mention of trade names, commercial products, or organizations imply endorsement by the US Government.

The financial support from Boston College is gratefully acknowledged, as well as that from the UK's National Foundation for Educational Research.

## IEA Secretariat

Seamus Hegarty, IEA Chair
Hans Wagemaker, Executive Director
Barbara Malak, Manager, Member Relations
Juriaan Hartenberg, Financial Manager
Paulína Koršňáková, Senior Professional Researcher
Isabelle Braun-Gémin, Financial Manager Assistant
David Ebbs, Management Assistant
Alana Yu, Management Assistant
TIMSS \& PIRLS International Study Center at Boston College
Ina V.S. Mullis, Executive Director
Michael O. Martin, Executive Director
Pierre Foy, Director of Sampling, Psychometrics, and Data Analysis
Paul Connolly, Director, Graphic Design and Publications
Alka Arora, Assistant Research Director, TIMSS Mathematics
Gabrielle M. Stanco, Assistant Research Director, TIMSS Science
Kathleen T. Drucker, Assistant Research Director, PIRLS Reading
Ieva Johansone, Assistant Research Director, Operations and Quality Control
Marcie Bligh, Manager of Office Administration
Bradley Brossman, Psychometrician (through 2012)
Courtney E. Castle, Graduate Assistant
Victoria A.S. Centurino, Graduate Assistant
Susan Farrell, Senior Data Graphics Specialist
Joseph Galia, Senior Statistician/Programmer
Christine Hoage, Manager of Finance
Lee R. Jones, Chief Science Consultant
Chad A. Minnich, Writer/Editor
Jennifer Moher Sepulveda, Data Graphics Specialist
Mario A. Pita, Senior Data Graphics Specialist
Jyothsna Pothana, Statistician/Programmer
Betty Poulos, Administrative Coordinator
Corinna Preuschoff, Senior Research Specialist (through 2011)
Moira A. Ragan, Graduate Assistant
Ruthanne Ryan, Data Graphics Specialist
Steven A. Simpson, Data Graphics Specialist

## IEA Data Processing and Research Center

Dirk Hastedt, Co-Director
Juliane Hencke, Project Co-Manager, TIMSS and PIRLS data processing
Oliver Neuschmidt, Project Co-Manager, TIMSS and PIRLS data processing
Yasin Afana, Deputy Project Manager, TIMSS and PIRLS data processing
Milena Taneva, Deputy Project Manager, TIMSS and PIRLS data processing
Alena Becker, Research Analyst
Christine Busch, Research Analyst
Ralph Carstens, Senior Research Analyst
Mark Cockle, Research Analyst
Tim Daniel, Research Analyst
Limiao Duan, Research Analyst
Eugenio Gonzales, Unit Head, Research and Analysis
Pamela Inostroza, Research Analyst
Michael Jung, Research Analyst
Maike Junod, Programmer
Alexander Konn, Programmer
Marta Kostek-Drosihn, Unit Coordinator
Sabine Meinck, Research Analyst, Sampling
Sebastian Meyer, Research Analyst
Dirk Oehler, Research Analyst
Moritz Otto, Programmer
Devi Potham Rajendra Prasath, Programmer
Daniel Radtke, Research Analyst
Anke Sielemann, Research Analyst
Harpreet Singh Choudry, Unit Head, Software
Caroline Vandenplas, Research Analyst
Sabine Weber, Research Analyst
Bettina Wietzorek, Meeting and Seminar Coordinator
Meng Xue, Programmer
Olaf Zuehlke, Research Analyst, Sampling

[^12]:    625 summary
    Students can apply their understanding and knowledge in a variety of relatively complex situations and explain their reasoning. They can solve a variety of multi-step word problems involving whole numbers, including proportions. Students at this level show an increasing understanding of fractions and decimals. Students can apply geometric knowledge of a range of two- and three-dimensional shapes in a variety of situations. They can draw a conclusion from data in a table and justify their conclusion.

    Students can solve a variety of multi-step word problems involving whole numbers. They can solve proportion problems and number sentences involving whole numbers. Students at this level show an increasing understanding of fractions and decimals. They can determine equivalent fractions represented in a variety of ways. Given a fraction, they can identify a larger fraction with a different denominator. They can identify the smallest among a set of one- and two-place decimals and use their knowledge of decimals to solve two-step problems. They can identify a two-step rule for a linear relationship between the first and second numbers in a set of ordered pairs.
    Students can apply geometric knowledge of a range of two- and three-dimensional shapes in a variety of situations. They can estimate the length of a curved line. Students can use their knowledge of perimeter to solve a multi-step problem. Students can determine the areas of simple figures. For example, they can find the area of a figure composed of squares and half squares, determine the area of an isosceles triangle on a grid, and calculate the area of a rectangle. Students can determine the number of cubes that fill a given rectangular box.
    Students can organize, interpret, and represent data to solve two-step problems. They can draw a conclusion from data in a table and justify their conclusion.

[^89]:    * The TIMSS target population is the grade that represents four years or eight years of schooling counting from the first year of ISCED Level 1. However, IEA has a policy that students do not fall under the minimum average age of 9.5 years old (Fourth grade) or 13.5 years old (Eighth grade) at the time of testing, so England, Malta, and New Zealand assessed students in their fifth year or ninth year of formal schooling.

[^90]:    National Target Population does not include all of the International Target Population.
    National Defined Population covers $90 \%$ to $95 \%$ of National Target Population.
    3 National Defined population covers less than $90 \%$ of National Target population (but at least $77 \%$ ).
    a Exclusion rates for Georgia are slightly underestimated as some conflict zones were not covered and no official statistics were available

[^91]:    Ж Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds $25 \%$.
    $\psi$ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed $25 \%$ but exceeds $15 \%$.
    () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

[^92]:    2 Exhibit 5 of the TIMSS 2011 Encyclopedia provides information on the grade-to-grade structure of the curriculum for each TIMSS 2011 participant.
    3 The TIMSS 2011 fourth grade mathematics assessment contained 175 items, yielding 185 score points. However, following item review, response categories for one of the items were combined, resulting in data for 184 score points. Similarly, following item review, the 217 items and 232 score points in the eighth grade assessment were reduced to 230 score points.

[^93]:    * Of the 217 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 232 score points. Following item review, response categories for two of the items were combined, resulting in 230 score points.
    () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

[^94]:    4 It should be noted that the mathematics achievement presented in Exhibits F. 1 and F. 2 is based on average percent correct (the percentage of students in a country, averaged across all items), which is different from the average scale scores that are presented in Chapter 1.

[^95]:    5 Small differences in performance between adjacent countries shown in this exhibit usually are not statistically significant. The standard errors for the average percent correct statistics based on the TIMSS 2011 sample are provided in Exhibits F. 3 and F.4. For any sample average shown in Exhibits F. 1 and F.2, it can be said with 95 percent confidence that the corresponding value in the population falls between the sample estimate plus or minus two standard errors.

[^96]:    * Of the 175 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 185 score points. Following item review, response categories for

[^97]:    () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

    Note: Percentiles are defined in terms of percentages of students at or below a point on the scale.

[^98]:    () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

[^99]:    () Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.
