## Appendix C

## The Test-Curriculum Matching Analysis: Mathematics

TIMSS went to great lengths to ensure that comparisons of student achievement across countries would be as fair and equitable as possible. The TIMSS 2007 Assessment Frameworks were designed to specify the important aspects of mathematics that participating countries agreed should be the focus of an international assessment of mathematics achievement, and the assessment items were developed through a collaborative process with national representatives to faithfully represent the specifications in the frameworks and field tested extensively in participating countries. Finalizing the TIMSS 2007 assessments involved a series of reviews by representatives of the participating countries, experts in mathematics, and testing specialists. At the end of this process, the National Research Coordinators from each country formally approved the TIMSS 2007 assessments, thus accepting them as being sufficiently fair to compare their students' mathematics achievement with that of students from other countries.

Although the assessments were developed to represent an agreed-upon framework and were intended to have as much in common across countries as possible, it was unavoidable that the match between the TIMSS 2007 assessment (or test) and the mathematics curriculum would not be the same in all countries. To restrict test items to just those topics included in the curricula of all participating countries and covered in the same sequence would severely limit test coverage and restrict the research questions that the
study is designed to address. The tests, therefore, inevitably have some items measuring topics unfamiliar to some students in some countries.

The Test-Curriculum Matching Analysis (TCMA) was conducted to investigate the extent to which the TIMSS 2007 mathematics assessment was relevant to each country's curriculum. The TCMA also investigates the impact on a country's performance of including only achievement items that were judged to be relevant to its own curriculum. ${ }^{1}$

To gather data about the extent to which the TIMSS 2007 tests were relevant to the curricula of the TIMSS countries and benchmarking participants, national coordinators were asked to examine each achievement item and indicate whether the item was in their country's intended curriculum at the grade tested (fourth or eighth grade). The national coordinator was asked to choose persons very familiar with the curriculum at these grades to make this determination. In some countries, the curriculum was prescribed for a range of grades and was not explicit about what was to be covered by the end of fourth or eighth grades. For example, in Sweden the curriculum specifies the curricular goals to be achieved by the end of the fifth and ninth grades, but does not provide a grade by grade specification. In such situations, coordinators were asked to make the best judgment possible. ${ }^{2}$ Since an item might be in the curriculum for some but not all students in a country, coordinators were asked to consider an item included if it was in the intended curriculum for more than 50 percent of the students. All TIMSS 2007 participants took part in the TCMA analysis except Algeria, Armenia, El Salvador, Kuwait, Latvia, Lithuania, and the Ukraine at fourth grade and Algeria, Armenia, Bulgaria, El Salvador, Kuwait, Lithuania, Saudi Arabia, and the Ukraine at eighth grade.

Exhibits C. 1 and C. 2 present the TCMA results for the TIMSS 2007 mathematics test at fourth and eighth grades. Exhibit C. 1 shows the average percent correct on the mathematics items judged appropriate by each country. Exhibit C. 2 shows the standard errors corresponding to the percentages presented in Exhibit C.1.

In Exhibit C.1, the bottom row of the exhibit shows the number of items, in terms of score points, identified as appropriate in each country. At the

[^0]fourth grade, the maximum number of score points in the assessment was 188 points. ${ }^{3}$ Generally, the proportion of items judged appropriate was fairly high. Reading along the bottom row, it can be seen that 19 of the 29 countries and 5 of the 7 benchmarking participants that took part in the TCMA analysis judged 75 percent or more ( 141 score points) to be appropriate. Only four participants-the Russian Federation, the Slovak Republic, Tunisia, and Yemen-judged half of the mathematics items or less to be included in their curricula.

At the eighth grade, the percentage of items judged appropriate was somewhat higher; with 8 of the 41 countries and 2 of the 7 benchmarking participants that took part in the TCMA analysis accepting 100 percent of the items (all 236 score points) and an additional 29 countries and 5 benchmarking participants accepting 75 percent or more ( 177 score points). For all participants, the majority of eighth grade mathematics was judged to be appropriate to their curricula.

Since most countries indicated that at least some items were not included in their intended curriculum at the grade tested, the data were analyzed to determine whether the inclusion of these items had any effect on the international performance comparisons. ${ }^{4}$

The first column of data in Exhibit C. 1 shows the average percent correct on all test items for each participant, together with its standard error. Subsequent columns show the performance of each participant on those items judged appropriate by the participant listed at the head of the column. Participants are presented in order of their performance based on average percent correct on all items, from highest to lowest. To interpret this exhibit, choosing a country and reading across its row provides the average percent correct for the students in that country on the items selected by each of the countries listed along the top of the exhibit. For example, at the fourth grade, Hong Kong SAR, where the average percent correct was 78 percent on its own set of items, had 77 percent correct on the items selected by Singapore, 78 percent on the items selected by Chinese Taipei, 77 percent on the items selected by Japan, and so forth. The column for a country listed at the top shows how each of the other participants performed

TIMSS \& PIRLS International Study Center International Study Center
Lynch School of Education, Boston College
on the set of items selected as appropriate for that country's students. Using the set of items selected by the Netherlands as an example, 79 percent of these items, on average, were answered correctly by students in Hong Kong SAR, 76 percent by students in Singapore, 72 percent by students in Chinese Taipei, 69 percent by students in Japan, 65 percent by those in Kazakhstan, and so forth. The shaded diagonal element in the exhibit shows how each country performed on the set of items that it selected based on its own curriculum. Thus, students from the Netherlands averaged 62 percent correct on the set of items identified by the Netherlands for the analysis.

For each country's selected items, the international averages across participating countries are presented in the lower part of the exhibit. These show that the selections of items by the participating countries varied somewhat in average difficulty, ranging at the fourth grade from 49 percent correct, for several participants, to 54 percent correct for those chosen by the Russian Federation. At the eighth grade, the average percent correct ranged from 40 percent, for many participants, to 43 percent for those chosen by Scotland.

Comparing the diagonal element for a country with the overall average percent correct shows the difference between performance on the set of items chosen as appropriate for that country and performance on the test as a whole. In general, countries performed better on their own item sets than on the items overall, although not by much. To illustrate, the average percent correct for Hong Kong SAR across all fourth-grade mathematics items was 77 percent. The diagonal element shows that students from Hong Kong had a slightly greater average percent correct ( 78 percent) across the set of items selected as appropriate for Hong Kong than they did overall. Almost all participants had a difference of one or two percentage points between the two performance measures, with the largest differences in the Russian Federation (11 percentage points), Tunisia and the province of Alberta (6 percentage points), and Austria and the Slovak Republic ( 5 percentage points). At the eighth grade, the differences were generally less; the largest being in Scotland (7 percentage points), and Malaysia and the Russian Federation (3 percentage points).

It is clear that the selection of items does not have a major effect on the relative performance among TIMSS participants. Participants that had relatively high or low performance across all the mathematics items also had relatively high or low performance on each of the various sets of items selected for the TCMA. For example, at the fourth grade, Hong Kong SAR had the highest average percent correct not only on the test as a whole, but also on all of the different item selections, with Singapore, Chinese Taipei, and Japan next in order of performance on practically all selections of items. Although there are some changes in the ordering of countries based on the items selected for the TCMA, most of these differences are within the boundaries of sampling error. ${ }^{5}$

Even when countries performed better on the items judged by them to be included in their curriculum than they did overall, their performance relative to other participants was little changed. As an example, consider the 68 score points selected by the Russian Federation at the fourth grade. The students in the Russian Federation did better on these items ( $73 \%$ correct) than on the test as a whole ( $62 \%$ correct). However, most other countries also did better on these particular items, with an international average of 54 percent correct compared with 49 percent correct overall. The countries that performed better than the Russian Federation on the overall test also performed as well or better on the items selected by the Russian Federation.

The TCMA results provide evidence that the TIMSS 2007 mathematics assessment provides a reasonable basis for comparing achievement of the participating countries and benchmarking entities. This result is not unexpected, since making the assessment as fair as possible was a major consideration in test development. The fact that the majority of countries indicated that most items were appropriate for their students means that the different average percent correct estimates were based on many of the same items. Insofar as countries rejected items that would be difficult for their students, these items tended to be difficult for students in other countries as well. The analysis shows that omitting such items tends to improve the results for that country, but also tends to improve the results for all other countries, so that the overall pattern of relative performance is largely unaffected.

5 Small differences in performance between adjacent countries shown in this exhibit usually are not statistically significant. The standard errors for the average percent correct statistics based on the TIMSS 2007 sample are provided in Exhibit C.2. For any sample average shown in Exhibit C.1, it can be said with 95 percent confidence that the corresponding value in the population falls between the sample estimate plus or minus two standard errors.

## Exhibit C. 1 Average Percent Correct for Test-Curriculum Matching <br> TIMSS2007 $\boldsymbol{4}^{\text {th }}$ Analysis - Mathematics

Based on Subset of Items Specially Identified by Each Country as Addressing its Curriculum (See Exhibit C. 2 for corresponding standard errors)
Instructions: Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

TIMSS2007 $4^{\text {th }}$ Mathematics Grade

Based on Subset of Items Specially Identified by Each Country as Addressing its Curriculum (See Exhibit C. 2 for corresponding standard errors)
Instructions: Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

Number of Items
(Score Points) Identified*

* Of the 215 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 238 total score points. Following item review, some
items were deleted and response categories were combined for a number of items, resulting in 214 items and 236 score points.

Lynch School of Education, Boston College

Exhibit C. 1 Average Percent Correct for Test-Curriculum Matching Analysis - Mathematics (Continued)

TIMSS2007 $0^{\text {th }}$ Mathematics 6 Grade
Based on Subset of Items Specially Identified by Each Country as Addressing its Curriculum (See Exhibit C. 2 for corresponding standard errors)
Instructions: Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

```
Number of Items
(Score Points) Identified*
```

* Of the 179 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 192 total score points. Following item review, some
items were deleted and response categories were combined for a number of items, resulting in 177 items and 188 score points.

## Exhibit C. 2 Standard Errors for the Test-Curriculum Matching Analysis - Mathematics (Continued)

TIMSS2007 $\boldsymbol{\Lambda}^{\text {th }}$ Mathematics Grade

Instructions: Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

Number of Items
(Score Points) Identified*

* Of the 215 items in the Mathematics test, some extended-response items were scored on a two-point scale, resulting in 238 total score points. Following item review, some
items were deleted and response categories were combined for a number of items, resulting in 214 items and 236 score points.

Exhibit C. 2 Standard Errors for the Test-Curriculum Matching Analysis - Mathematics (Continued)

TIMSS2007 $0^{\text {th }}$ Mathematics 6 Grade
Instructions: Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

[^0]:    1 Because there may also be curriculum areas covered in some countries that are not covered by the TIMSS 2007 tests, the TCMA does not provide complete information about how well the tests cover the curricula of the countries.
    2 Exhibit 5 of the TIMSS 2007 Encyclopedia provides information on the grade-to-grade structure of the curriculum for each TIMSS 2007 participant.
