## -Executive Summary

## MATHEMATICS

Since its inception in 1959, the International Association for the Evaluation of Educational Achievement (IEA) has conducted a series of international comparative studies designed to provide policy makers, educators, researchers, and practitioners with information about educational achievement and learning contexts. The Third International Mathematics and Science Study (TIMSS) is the largest and most ambitious of these studies ever undertaken.

The scope and complexity of TIMSS is enormous. Forty-five countries collected data in more than 30 different languages. Five grade levels were tested in the two subject areas, totaling more than half a million students tested around the world. The success of TIMSS depended on a collaborative effort between the research centers in each country responsible for implementing the steps of the project and the network of centers responsible for managing the across-country tasks such as training country representatives in standardized procedures, selecting comparable samples of schools and students, and conducting the various steps required for data processing and analysis. Including the administrators in the approximately 15,000 schools involved, many thousands of individuals around the world were involved in the data collection effort. Most countries collected their data in May and June of 1995, although those countries on a southern hemisphere schedule tested in late 1994, which was the end of their school year.

Six content dimensions were covered in the TIMSS mathematics tests given to the middle-school students: fractions and number sense; measurement; proportionality; data representation, analysis, and probability; geometry; and algebra. About one-fourth of the questions were in the free-responses format requiring students to generate and write their answers. These types of questions, some of which required extended responses, were allotted approximately one-third of the testing time. Chapter 3 of this report contains 33 example items illustrating the range of mathematics concepts and processes addressed by the TIMSS test.

Because the home, school, and national contexts within which education takes place can play important roles in how students learn mathematics, TIMSS collected extensive information about such background factors. The students who participated in TIMSS completed questionnaires about their home and school experiences related to learning mathematics. Also, teachers and school administrators completed questionnaires about instructional practices. System-level information was provided by each participating country.

TIMSS was conducted with attention to quality at every step of the way. Rigorous procedures were designed specifically to translate the tests, and numerous regional training sessions were held in data collection and scoring procedures. Quality control monitors observed testing sessions, and sent reports back to the TIMSS International Study Center at Boston College. The samples of students selected for testing were scrutinized according to rigorous standards designed to prevent
bias and ensure comparability. In this publication, the countries are grouped for reporting of achievement according to their compliance with the sampling guidelines and the level of their participation rates. Prior to analysis, the data from each country were subjected to exhaustive checks for adherence to the international formats as well as for within-country consistency and comparability across countries.

The results provided in this report describe students' mathematics achievement at both the seventh and eighth grades. For most, but not all TIMSS countries, the two grades tested at the middle-school level represented the seventh and eighth years of formal schooling. Special emphasis is placed on the eighth-grade results, including selected information about students' background experiences and teachers' classroom practices in mathematics. Results are reported for the 41 countries that completed all of the steps on the schedule necessary to appear in this report. The results for students in the third and fourth grades, and for those in their final year of secondary school will appear in subsequent reports.

The following sections summarize the major findings described in this report.

## Students' Mathematics Achievement

Singapore was the top-performing country at both the eighth and seventh grades. Korea, Japan, and Hong Kong also performed very well at both grades as did Flemish-speaking Belgium and the Czech Republic. Lower-performing countries included Colombia, Kuwait, and South Africa (see Tables 1.1 and 1.2; Figures 1.1 and 1.2).

Perhaps the most striking finding was the large difference in average achievement between the top-performing and bottom-performing countries. Despite this large difference, when countries were ordered by average achievement there were only small or negligible differences in achievement between one country and the one with the next-lowest average achievement. In some sense, at both grades, the results provide a chain of overlapping performances, where most countries had average achievement similar to a cluster of other countries, but from the beginning to the end of the chain there were substantial differences. For example, at both grades, average achievement in top-performing Singapore was comparable to or even exceeded performance for $95 \%$ of the students in the lowest-performing countries.

For most countries, gender differences in mathematics achievement were small or essentially non-existent. However, the direction of the gender differences that did exist favored boys rather than girls. Similarly, within the mathematics content areas, there were few differences in performance between boys and girls. Again, the few differences that did occur favored boys (except in algebra, where, if anything, the differences favored girls).

Compared to their overall performance in mathematics, nearly all countries did relatively better in several content areas than they did in others. Consistent with the idea of countries having different emphases in curriculum, those that performed relatively better in fractions and number sense tended to be different from those that performed relatively better in geometry and algebra.

Even though students in the top-performing countries had very high achievement on many of the test questions, both seventh and eighth graders, in most countries, had difficulty with multi-step problem solving and applications. For example, students were asked to actually draw a new rectangle whose length was one and one-half times the length of a given rectangle and whose width was half the width of that rectangle. In only two countries (Korea and Austria) did at least half the eighth-grade students correctly draw the new rectangle.

Students also found the proportionality items difficult. For example, one of the least difficult problems in this area asked about adding 5 girls and 5 boys to a class that was three-fifths girls. On average, fewer than two-thirds of the students across countries correctly answered that there would still be more girls than boys in the class.

In algebra, $58 \%$ of the eighth-grade students across countries, on average, identified $4 m$ as being equivalent to $m+m+m+m$. There was however, a very large range in performance from country to country. Seventy-five percent or more of the eighth graders answered this question correctly in the Czech Republic, Hong Kong, Japan, the Russian Federation, Singapore, the Slovak Republic, and Slovenia.

## Students' Attitudes Towards Mathematics

Within nearly every country, a clear positive relationship was observed between a stronger liking of mathematics and higher achievement. Even though the majority of eighth graders in nearly every country indicated they liked mathematics to some degree, clearly not all students feel positive about this subject area. In Austria, the Czech Republic, Germany, Hungary, Japan, Korea, Lithuania, and the Netherlands, more than 40\% of the students reported disliking mathematics.

In no country, did eighth-grade girls report a stronger liking of mathematics than did boys. However, boys reported liking mathematics better than girls did in several countries, including Austria, France, Germany, Hong Kong, Japan, Norway, and Switzerland.

In all except four countries, the majority of students agreed or strongly agreed that they did well in mathematics - a perception that did not always coincide with the comparisons in achievement across countries on the TIMSS test. Interestingly, the exceptions included three of the highest performing countries - Hong Kong, Japan, and Korea - where more than $50 \%$ of the students disagreed or strongly disagreed about doing well (the fourth was Lithuania). It should be noted, however, that within nearly all countries there was a clear relationship between perception and performance, with those students reporting higher selfperceptions of doing well in mathematics also having higher average achievement.

Internationally, the most frequently cited reason for needing to do well in mathematics was to get into students' desired secondary school or university.

## Home Environment

Home factors were strongly related to mathematics achievement in every country that participated in TIMSS.

In every country, eighth-grade students who reported having more educational resources in the home had higher mathematics achievement than those who reported little access to such resources. Strong positive relationships were found between mathematics achievement and having study aids in the home, including a dictionary, a computer, and a study desk/table for the student's own use.

The number of books in the home can be an indicator of a home environment that values and provides general academic support. In most TIMSS countries, the more books students reported in the home, the higher their mathematics achievement.

In every country, the pattern was for the eighth-grade students whose parents had more education to also have higher achievement in mathematics.

Beyond the one to two hours of daily television viewing reported by close to the majority of eighth graders in all participating countries, the amount of television students watched was negatively associated with mathematics achievement.

In most countries, eighth graders reported spending as much out-of-school time each day in non-academic activities as they did in academic activities. Besides watching television, students reported spending several hours, on average, each day playing or talking with friends, and nearly two hours playing sports. (It should be noted, however, the time spent in these activities is not additive because students can talk with their friends at sporting events or while watching TV, for example.)

## Instructional Contexts and Practices

In comparison to the positive relationships observed between mathematics achievement and home factors, the relationships were less clear between achievement and various instructional variables, both within and across countries. Obviously, educational policies and practices such as tracking and streaming serve to systematically confound these relationships. Also, the interaction among instructional variables can be extremely complex and merits further study.

The qualifications required for teaching certification were relatively uniform across countries. Most countries reported that four years of post-secondary education were required, even though there was a range from two to six years. Almost all countries reported that teaching practice was a requirement, as was an examination or evaluation.

Teachers in most countries reported that mathematics classes typically meet for at least two hours a week, but less than three and one-half hours. Weekly instructional time of from three and one-half hours up to five hours also was common for a number of countries. The data, however, revealed no clear pattern between the number of in-class instructional hours and mathematics achievement.

There was considerable variation in class size. In a number of countries, nearly all students ( $90 \%$ or more) were in classes of fewer than 30 students. At the other end of the spectrum, $93 \%$ of the students in Korea were in classes with more than 40 students. The TIMSS data showed different patterns of mathematics achievement in relation to class size for different countries.

Small-group work was used less frequently than other instructional approaches. Across countries, mathematics teachers reported that working together as a class with the teacher teaching the whole class, and having students work individually with assistance from the teacher were the most frequently used instructional approaches.

In most participating countries, teachers reported using a textbook in teaching mathematics for $95 \%$ or more of the students. Relatively uniformly, the majority of students were asked both to practice computation and do some type of reasoning tasks in most or every lesson.

Regarding the use of technology, teachers in many countries reported three-fourths or more of the eighth graders used calculators almost every day in their mathematics classes, often for checking answers, routine computation, and solving complex problems. An exception was Korea, where it was reported that calculators were seldom used. Teachers and students agreed that the computer was almost never used in most students’ mathematics lessons.

Eighth graders in about half the countries reported doing an average of two to three hours per day of homework, with those in many countries reporting studying mathematics for roughly an hour each day. There was a range from half an hour to two hours per day spent on mathematics homework and about two to five hours overall, but the relationship between amount of homework done and level of mathematics achievement was inconsistent.

Eighth-grade students reported substantial variation in the frequency of testing in mathematics classes. In a number of countries, the majority of the eighth-grade students reported having quizzes and tests only once in while or never. In contrast, one-third or more of the students reported almost always having quizzes or tests in Colombia, Hong Kong, Kuwait, Romania, Spain, and the United States.

## -Introduction

## MATHEMATICS

As the 21 st century approaches, technology is having more and more impact on the daily lives of individuals throughout the world. It influences our receipt of news and information, how we spend our leisure time, and where we work. At an ever-increasing pace, technology also is becoming a major factor in determining the economic health of countries. To ensure their economic well-being, countries will need citizens prepared to participate in "brain-power" industries such as micro-electronics, computers, and telecommunications. The young adolescents of today will be seeking jobs in a global economy requiring levels of technical competence and flexible thinking that were required by only a few workers in the past. To make sensible decisions and participate effectively in a world transformed by the ability to exchange all types of information almost instantly, these students will need to be well educated in a number of core areas, especially mathematics and science.

The fact that skills in mathematics and science are so critical to economic progress in a technologically-based society has led countries to seek information about what their school-age populations know and can do in mathematics and science. There is interest in what concepts students understand, how well they can apply their knowledge to problem-solving situations, and whether they can communicate their understandings. Even more vital, countries are desirous of furthering their knowledge about what can be done to improve students' understanding of mathematical concepts, their ability to solve problems, and their attitudes toward learning.

The Third International Mathematics and Science Study (TIMSS) provided countries with a vehicle for investigating these issues while expanding their perspectives of what is possible beyond the confines of their national borders. It is the most ambitious and complex comparative education study in a series of such undertakings conducted during the past 37 years by the International Association for the Evaluation of Educational Achievement (IEA). ${ }^{1}$ The main purpose of TIMSS was to focus on educational policies, practices, and outcomes in order to enhance mathematics and science learning within and across systems of education.

With its wealth of information covering more than half a million students at five grade levels in 15,000 schools and more than 40 countries around the world, TIMSS offers an unprecedented opportunity to examine similarities and differences in how mathematics and science education works and how well it works. The study used innovative testing approaches and collected extensive information about the contexts within which students learn mathematics and science.

[^0]The present report focuses on the mathematics achievement of students in the two grades with the largest proportion of 13-year-olds - the seventh and eighth grades in most countries. Special emphasis is placed on the eighth-grade results, including selected information about students' background and classroom practices in teaching mathematics.

All countries that participated in TIMSS were to test students in the two grades with the largest proportion of 13 -year-olds in both mathematics and science. A companion report, Science Achievement in the Middle School Years: IEA's Third International Mathematics and Science Study (TIMSS), ${ }^{2}$ presents corresponding results about students' science achievement.

Many TIMSS countries also tested the mathematics and science achievement of students in the two grades with the largest proportion of 9 -year-olds (third and fourth grades in most countries) and of students in their final year of secondary education. Subsets of students, except the final-year students, also had the opportunity to participate in a "hands-on" performance assessment where they designed experiments and tested hypotheses. The results of these components of TIMSS will be presented in forthcoming reports.

Together with the achievement tests, TIMSS administered a broad array of background questionnaires. The data collected from students, teachers, and school principals, as well as the system-level information collected from the participating countries, provide an abundance of information for further study and research. TIMSS data make it possible to examine differences in current levels of performance in relation to a wide variety of variables associated with classroom, school, and national contexts within which education takes place.

## Which Countries Participated?

TIMSS was very much a collaborative process among countries. Table 1 shows the 45 participating countries. Each participant designated a national center to conduct the activities of the study and a National Research Coordinator (NRC) to assume responsibility for the successful completion of these tasks. ${ }^{3}$ For the sake of comparability, all testing was conducted at the end of the school year. The four countries on a Southern Hemisphere school schedule (Australia, Korea, New Zealand, and Singapore) tested in September through November of 1994, which was the end of the school year in the Southern Hemisphere. The remaining countries tested the mathematics and science achievement of their students at the end of the 1994-95 school year, most often in May and June of 1995. Because Argentina, Italy, and Indonesia were unable to complete the steps necessary to appear in this report, the tables throughout the report do not include data for these three countries. Results also are not presented for Mexico, which chose not to release its seventh- and eighth-grade results in the international reports.

[^1]
## Countries Participating in TIMSS ${ }^{1}$

- Argentina
- Australia
- Austria
- Belgium *
- Bulgaria
- Canada
- Colombia
- Cyprus
- Czech Republic
- Denmark
- England
- France
- Germany
- Greece
- Hong Kong
- Hungary
- Iceland
- Indonesia
- Iran, Islamic Republic
- Ireland
- Israel
- Italy
- Japan
- Korea, Republic of
- Kuwait
- Latvia
- Lithuania
- Mexico
- Netherlands
- New Zealand
- Norway
- Philippines
- Portugal
- Romania
- Russian Federation
- Scotland
- Singapore
- Slovak Republic
- Slovenia
- South Africa
- Spain
- Sweden
- Switzerland
- Thailand
- United States
* The Flemish and French educational systems in Belgium participated separately.

[^2]Table 2 shows information about the lower and upper grades tested in each country, including the country names for those two grades and the years of formal schooling students in those grades had completed when they were tested for TIMSS. Table 2 reveals that for most, but not all, countries, the two grades tested represented the seventh and eighth years of formal schooling. Thus, solely for convenience, the report often refers to the upper grade tested as the eighth grade and the lower grade tested as the seventh grade. As a point of interest, a system-split (where the lower grade was in upper primary and the upper grade was in lower secondary) occurred in six countries: New Zealand, Norway, the Philippines, South Africa, Sweden, and Switzerland. Two countries, Israel and Kuwait, tested only at the upper grade.

Having valid and efficient samples in each country is crucial to the quality and success of any international comparative study. The accuracy of the survey results depends on the quality of sampling information available, and particularly on the quality of the samples. TIMSS developed procedures and guidelines to ensure that the national samples were of the highest quality possible. Standards for coverage of the target population, participation rates, and the age of students were established, as were clearly documented procedures on how to obtain the national samples. For the most part, the national samples were drawn in accordance with the TIMSS standards, and achievement results can be compared with confidence. However, despite efforts to meet the TIMSS specifications, some countries did not do so. These countries are specially annotated and/or shown in separate sections of the tables in this report. ${ }^{4}$

Table 2
Information About the Grades Tested

| Country | Lower Grade |  | Upper Grade |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Country's Name for Lower Grade | Years of Formal Schooling Including Lower Grade ${ }^{1}$ | Country's Name for Upper Grade | Years of Formal Schooling Including Upper Grade ${ }^{1}$ |
| ${ }^{2}$ Australia | 7 or 8 | 7 or 8 | 8 or 9 | 8 or 9 |
| Austria | 3. Klasse | 7 | 4. Klasse | 8 |
| Belgium (Fl) | 1A | 7 | 2 A \& 2 P | 8 |
| Belgium (Fr) | 1A | 7 | 2 A \& 2 P | 8 |
| Bulgaria | 7 | 7 | 8 | 8 |
| Canada | 7 | 7 | 8 | 8 |
| Colombia | 7 | 7 | 8 | 8 |
| Cyprus | 7 | 7 | 8 | 8 |
| Czech Republic | 7 | 7 | 8 | 8 |
| Denmark | 6 | 6 | 7 | 7 |
| England | Year 8 | 8 | Year 9 | 9 |

| Germany | 7 | 7 | 8 | 8 |
| Greece | Secondary 1 | 7 | Secondary 2 | 8 |
| Hong Kong | Secondary 1 | 7 | Secondary 2 | 8 |
| Hungary | 7 | 7 | 8 | 8 |
| Iceland | 7 | 7 | 8 | 8 |
| Iran, Islamic Rep. | 7 | 7 | 8 | 8 |
| Ireland | 1st Year | 7 | 2nd Year | 8 |
| Israel | - | - | 8 | 8 |
| Japan | 1st Grade Lower Secondary | 7 | 2nd Grade Lower Secondary | 8 |
| Korea, Republic of | 1st Grade Middle School | 7 | 2nd Grade Middle School | 8 |
| Kuwait | - | - | 9 | 9 |
| Latvia | 7 | 7 | 8 | 8 |
| Lithuania | 7 | 7 | 8 | 8 |
| Netherlands | Secondary 1 | 7 | Secondary 2 | 8 |
| 3,4 New Zealand | Form 2 | 7.5-8.5 | Form 3 | 8.5-9.5 |
| ${ }^{3}$ Norway | 6 | 6 | 7 | 7 |
| ${ }^{3}$ Philippines | Grade 6 Elementary | 6 | 1st Year High School | 7 |
| Portugal | Grade 7 | 7 | Grade 8 | 8 |
| Romania | 7 | 7 | 8 | 8 |
| ${ }^{5}$ Russian Federation | 7 | 6 or 7 | 8 | 7 or 8 |
| Scotland | Secondary 1 | 8 | Secondary 2 | 9 |
| Singapore | Secondary 1 | 7 | Secondary 2 | 8 |
| Slovak Republic | 7 | 7 | 8 | 8 |
| Slovenia | 7 | 7 | 8 | 8 |
| Spain | 7 EGB | 7 | 8 EGB | 8 |
| ${ }^{3}$ South Africa | Standard 5 | 7 | Standard 6 | 8 |
| ${ }^{3}$ Sweden | 6 | 6 | 7 | 7 |
| 3 Switzerland <br> (German) <br> (French and Italian) | $\begin{aligned} & 6 \\ & 7 \end{aligned}$ | 6 7 | $\begin{aligned} & 7 \\ & 8 \end{aligned}$ | 7 8 |
| Thailand | Secondary 1 | 7 | Secondary 2 | 8 |
| United States | 7 | 7 | 8 | 8 |

${ }^{1}$ Years of schooling based on the number of years children in the grade level have been in formal schooling, beginning with primary education (International Standard Classification of Education Level 1). Does not include preprimary education.
${ }^{2}$ Australia: Each state/territory has its own policy regarding age of entry to primary school. In 4 of the 8 states/territories students were sampled from grades 7 and 8 ; in the other four states/territories students were sampled from grades 8 and 9.
${ }^{3}$ Indicates that there is a system-split between the lower and upper grades. In Switzerland there is a system-split in 14 of 26 cantons.
${ }^{4}$ New Zealand: The majority of students begin primary school on or near their 5th birthday so the "years of formal schooling" vary.
${ }^{5}$ Russian Federation: $70 \%$ of students in the seventh grade have had 6 years of formal schooling; 70\% in the eighth grade have had 7 years of formal schooling.

## What Was the Nature of the Mathematics Test?

Together with the quality of the samples, the quality of the test also receives considerable scrutiny in any comparative study. All participants wish to ensure that the achievement items are appropriate for their students and reflect their current curriculum. Developing the TIMSS tests was a cooperative venture involving all of the NRCs during the entire process. Through a series of efforts, countries submitted items that were reviewed by mathematics subject-matter specialists, and additional items were written to ensure that the desired mathematics topics were covered adequately. Items were piloted, the results reviewed, and new items were written and piloted. The resulting TIMSS mathematics test contained 151 items representing a range of mathematics topics and skills.

The TIMSS curriculum frameworks described the content dimensions for the TIMSS tests as well as performance expectations (behaviors that might be expected of students in school mathematics). ${ }^{5}$ Six content areas are covered in the mathematics test taken by seventh- and eighth-grade students. These areas and the percentage of the test items devoted to each include: fractions and number sense ( $34 \%$ ); measurement ( $12 \%$ ); proportionality ( $7 \%$ ); data representation, analysis, and probability ( $14 \%$ ); geometry ( $15 \%$ ); and algebra ( $18 \%$ ). The performance expectations include: knowing ( $22 \%$ ); performing routine procedures ( $25 \%$ ); using complex procedures ( $21 \%$ ); and solving problems ( $32 \%$ ).

About one-fourth of the questions were in the free-response format, requiring students to generate and write their answers. These questions, some of which required extended responses, were allotted approximately one-third of the testing time. Responses to the free-response questions were evaluated to capture diagnostic information, and some were scored using procedures that permitted partial credit. ${ }^{6}$ Chapter 3 of this report contains 33 example items illustrating the range of mathematics concepts and processes addressed by the TIMSS test.

The TIMSS tests were prepared in English and translated into 30 additional languages using explicit guidelines and procedures. A series of verification checks were conducted to ensure the comparability of the translations. ${ }^{7}$

The tests were given so that no one student took all of the items, which would have required more than three hours. Instead, the test was assembled in eight booklets, each requiring 90 minutes to complete. Each student took only one booklet, and the items were rotated through the booklets so that each one was answered by a representative sample of students.

[^3]TIMSS conducted a Test-Curriculum Matching Analysis whereby countries examined the TIMSS test to identify items measuring topics not addressed in their curricula. The analysis showed that omitting such items for each country had little effect on the overall pattern of achievement results across all countries. ${ }^{8}$

## How Do Country Characteristics Differ?

International studies of student achievement provide valuable comparative information about student performance and instructional practices. Along with the benefits of international studies, though, are challenges associated with comparing achievement across countries, cultures, and languages. In TIMSS, extensive efforts were made to attend to these issues through careful planning and documentation, cooperation among the participating countries, standardized procedures, and rigorous attention to quality control throughout. ${ }^{9}$

Beyond the integrity of the study procedures, the results of comparative studies such as TIMSS also need to be considered in light of the larger contexts in which students are educated and the kinds of system-wide factors that might influence students' opportunity to learn. A number of these factors are more fully described in National Contexts for Mathematics and Science Education: An Encyclopedia of the Education Systems Participating in TIMSS; ${ }^{10}$ however, some selected demographic characteristics of the TIMSS countries are presented in Table 3. Table 4 contains information about public expenditure on education. The information in these two tables shows that some of the TIMSS countries are densely populated and others are more rural, some are large and some small, and some expend considerably more resources on education than others. Although these factors do not necessarily determine high or low performance in mathematics, they do provide a context for considering the difficulty of the educational task from country to country.

Describing students' educational opportunities also includes understanding the knowledge and skills that students are supposed to master. To help complete the picture of educational practices in the TIMSS countries, mathematics and curriculum specialists within each country provided detailed categorizations of their curriculum guides, textbooks, and curricular materials. The initial results from this effort can be found in two reports, entitled Many Visions, Many Aims: A Cross-National Investigation of Curricular Intentions in School Mathematics and Many Visions, Many Aims: A Cross-National Investigation of Curricular Intentions in School Science. ${ }^{11}$

[^6]Depending on the educational system, students' learning goals are commonly set at one of three main levels: the national or regional level, the school level, or the classroom level. Some countries are highly centralized, with the ministry of education (or highest authority in the system) having exclusive responsibility for making the major decisions governing the direction of education. In others, such decisions are made regionally or locally. Each approach has its strengths and weaknesses. Centralized decision making can add coherence in curriculum coverage, but may constrain a school or teacher's flexibility in tailoring instruction to the different needs of students.

Figures 1, 2, and 3 show the degree of centralization in the TIMSS countries regarding decision-making about curriculum syllabi, textbooks, and examinations. Thirty of the TIMSS participants reported nationally-centralized decision-making about curriculum. Fewer countries reported nationally-centralized decision-making about textbooks, although 16 participants were in this category. Thirteen countries reported nationally-centralized decision-making about examinations. Regional decision-making about these three aspects of education does not appear very common among the TIMSS countries, with only a few countries reporting this level of decision-making for curriculum syllabi and textbooks, and none reporting it for examinations.

Most countries reported having centralized decision-making for one or two of the areas and "not centralized" decision-making for one or two of the areas. However, six countries - Bulgaria, Hong Kong, Lithuania, the Philippines, Romania, and Singapore - reported nationally-centralized decision-making for all three areas: curriculum syllabi, textbooks, and examinations. Six countries - Australia, Hungary, Iceland, Latvia, Scotland, and the United States - reported that decision-making is not centralized for any of these areas.

## Centralization of Decision-Making Regarding Curriculum Syllabi

${ }^{1}$ Belgium: In Belgium, decision-making is centralized separately for the two educational systems.
${ }^{2}$ Norway: The National Agency of Education provides goals which schools are required to work towards. Schools have the freedom to implement the goals based on local concerns.
${ }^{3}$ Spain: Spain is now reforming to a regionally centralized system with high responsibility at the school level.
${ }^{4}$ Sweden: The National Agency of Education provides goals which schools are required to work towards. Schools have the freedom to implement the goals based on local concerns.
${ }^{5}$ Switzerland: Decision-making regarding curricula in upper secondary varies across cantons and types of education.
${ }^{6}$ Australia: Students tested in TIMSS were educated under a decentralized system. Reforms beginning in 1994 are introducing regionally centralized (state-determined) curriculum guidelines.
${ }^{7}$ Denmark: The Danish Parliament makes decisions governing the overall aim of education, and the Minister of Education sets the target, the central knowledge, and proficiency for each subject and the grades for teaching the subject. The local school administration can implement the subjects from guidelines from the Ministry; however, these are recommendations and are not mandatory.
${ }^{8}$ Hungary: Hungary is in the midst of changing from a highly centralized system to one in which local authorities and schools have more autonomy. ${ }^{9}$ Netherlands: The Ministry of Education sets core objectives (for subjects in primary education and in 'basic education' at lower secondary level) and goals/objectives (for subjects in the four student ability tracks in secondary education) which schools are required to work towards. Schools have the freedom, though, to decide how to reach these objectives.

## Centralization of Decision-Making Regarding Textbooks

[^7]
## Centralization of Decision-Making Regarding Examinations

## Criteria

Countries are in the "Nationally Centralized" category regarding examinations if the highest level of decision-making authority within the educational system (e.g., the ministry of education) has exclusive responsibility for or gives final approval of the content of examinations. The notes explain during which school years the examinations are administered. If that decision-making body has less than exclusive responsibility for or final approval of the examination content, the country is in the "Not Centralized" category.

## Chapter 1

International Student Achievement in Mathematics

## What Are the Overall Differences in Mathematics Achievement?

Chapter 1 summarizes achievement on the TIMSS mathematics test for each of the participating countries. Comparisons are provided overall and by gender for the upper grade tested (often the eighth grade) and the lower grade tested (often the seventh grade), as well as for 13-year-olds.

Table 1.1 presents the mean (or average) achievement for 41 countries at the eighth grade. ${ }^{1}$ The 25 countries shown by decreasing order of mean achievement in the upper part of the table were judged to have met the TIMSS requirements for testing a representative sample of students. Although all countries tried very hard to meet the TIMSS sampling requirements, several encountered resistance from schools and teachers and did not have participation rates of $85 \%$ or higher as specified in the TIMSS guidelines (i.e., Australia, Austria, Belgium (French), Bulgaria, the Netherlands, and Scotland). To provide a better curricular match, four countries (i.e., Colombia, Germany, Romania, and Slovenia) elected to test their seventhand eighth-grade students even though that meant not testing the two grades with the most 13 -year-olds and led to their students being somewhat older than those in the other countries. The countries in the remaining two categories encountered various degrees of difficulty in implementing the prescribed methods for sampling classrooms within schools. Because the Philippines did not document clearly its procedures for sampling schools, its achievement results are presented in Appendix C. A full discussion of the sampling procedures and outcomes for each country can be found in Appendix A.

To aid in interpretation, the table also contains the years of formal schooling and average age of the students. Equivalence of chronological age does not necessarily mean that students have received the same number of years of formal schooling or studied the same curriculum. Most notably, students in the three Scandinavian countries, Sweden, Norway, and Denmark, had fewer years of formal schooling than their counterparts in other countries, ${ }^{2}$ and those in England, Scotland, New Zealand, and Kuwait had more. Countries with a high percentage of older students may have policies that include retaining students in lower grades.

[^9]
## Table 1.1

## Distributions of Mathematics Achievement - Upper Grade (Eighth Grade*)

[^10]SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95

## Multiple Comparisons of Mathematics Achievement - Upper Grade (Eighth Grade*)

Instructions: Read across the row for a country to compare performance with the countries listed in the heading of the chart. The symbols indicate whether the mean achievement of the country in the row is significantly lower than that of the comparison country, significantly higher than that of the comparison country, or if there is no statistically significant difference between the two countries. ${ }^{\dagger}$

[^11]SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

The results reveal substantial differences in average mathematics achievement between the top- and bottom-performing countries, although most countries had achievement somewhere in the middle ranges. To illustrate the broad range of achievement both across and within countries, Table 1.1 also provides a visual representation of the distribution of student performance within each country. Achievement for each country is shown for the 25th and 75th percentiles as well as for the 5th and 95th percentiles. ${ }^{3}$ Each percentile point indicates the percentages of students performing below and above that point on the scale. For example, $25 \%$ of the eighth-grade students in each country performed below the 25th percentile for that country, and $75 \%$ performed above the 25 th percentile.

The range between the 25 th and 75 th percentiles represents performance by the middle half of the students. In contrast, performance at the 5 th and 95 th percentiles represents the extremes in both lower and higher achievement. The dark boxes at the midpoints of the distributions show the $95 \%$ confidence intervals around the average achievement in each country. ${ }^{4}$ These intervals can be compared to the international average of 513, which was derived by averaging across the means for each of the 41 participants shown on the table. ${ }^{5}$ A number of countries had mean achievement well above the international average of 513, and others had mean achievement well below that level.

Comparisons also can be made across the means and percentiles. For example, average performance in Singapore was comparable to or even exceeded performance at the 95th percentile in the lower-performing countries such as Portugal, Iran, Kuwait, Colombia, and South Africa. Also, the differences between the extremes in performance were very large within most countries.

Figure 1.1 provides a method for making appropriate comparisons in overall mean achievement between countries. ${ }^{6}$ This figure shows whether or not the differences in mean achievement between pairs of countries are statistically significant. Selecting a country of interest and reading across the table, a triangle pointing up indicates significantly higher performance than the country listed across the top, a dot indicates no significant difference in performance, and a triangle pointing down indicates significantly lower performance.

At the eighth grade, Singapore, with all triangles pointing up, had significantly higher mean achievement than other participating countries. Korea, Japan, and Hong Kong also performed very well. Korea and Japan performed similarly to each other and better than all of the other participating countries except Singapore. Besides showing no significant difference from Korea and Japan, Hong Kong also performed about the same as Flemish-speaking Belgium and the Czech Republic. Interestingly, from the top-performing countries on down through the list of participants, the differences in

[^12]performance from one country to the next were often negligible. For example, in addition to performing similarly to each other and Hong Kong, Belgium-Flemish and the Czech Republic also performed similarly to the Slovak Republic, the Netherlands, and Bulgaria. In turn, the Slovak Republic also performed similarly to Switzerland, Slovenia, Austria, France, Hungary, and the Russian Federation.

Despite the small differences from one country to the next, however, spanning across all the participating TIMSS countries, the performance differences from the topperforming to the bottom-performing countries was very large. Because of this large range in performance, the pattern for a number of countries was one of having lower mean achievement than some countries, about the same mean achievement as some countries, and higher mean achievement than other countries. In contrast, Kuwait and Colombia, which performed similarly to each other, had significantly lower means than all other countries except South Africa.

Table 1.2 and Figure 1.2 present corresponding data for the seventh grade. ${ }^{7}$ The cluster of the four highest performing countries is the same as at the eighth grade. Seventhgrade students in Singapore had significantly higher mean achievement than other participating countries, with Korea, Japan, and Hong Kong also performing very well and similarly to each other. For the remaining countries, performance rankings tended to be similar, but not identical, to those found at the eighth grade. For example, at the seventh grade, Flemish-speaking Belgium had higher achievement than the Czech Republic. Flemish-speaking Belgium performed as well as Hong Kong but not as well as Korea and Japan. The Czech Republic, the Netherlands, Bulgaria, Austria, the Slovak Republic, and French-speaking Belgium all performed at about the same level.

It can be noted that the international average at the eighth grade (513) was nearly 30 points higher than the international average of 484 shown at the seventh grade. Even though equivalent achievement increases cannot be assumed from grade to grade throughout schooling, this 30-point difference does provide a rough indication of grade-by-grade increases in mathematics achievement during the middle school years. By this gauge, the achievement differences across countries at both grades reflect several grade levels in learning between the higher- and lower-performing countries. A similarly large range in performance can be noted within most countries. There needs to be a further note of caution, however, in using growth from grade to grade as an indicator of achievement. The TIMSS scale measures achievement in mathematics judged to be appropriate for seventh- and eighth-grade students around the world. Thus, higher performance does not mean students can do advanced secondaryschool mathematics, only that they are more proficient at middle-school mathematics.

## Multiple Comparisons of Mathematics Achievement - Lower Grade (Seventh Grade*)

Instructions: Read across the row for a country to compare performance with the countries listed in the heading of the chart. The symbols indicate whether the mean achievement of the country in the row is significantly lower than that of the comparison country, significantly higher than that of the comparison country, or if there is no statistically significant difference between the two countries. ${ }^{\dagger}$

## What Are the Increases in Achievement Between the Lower and Upper Grades?

Table 1.3 shows the increases in mean achievement between the two grades tested in each TIMSS country. Countries in the upper portion of the table are shown in decreasing order by the amount of this difference. Increases in mean performance between the two grades ranged from a high of 49 points in Lithuania to a low of 8 points in the Flemish-speaking part of Belgium ${ }^{8}$ and 7 points in South Africa. ${ }^{9}$ This degree of increase can be compared to the difference of nearly 30 points between the international average of 513 at eighth grade and that of 484 at seventh grade. Despite the larger increases in some countries compared to others, there is no obvious relationship between mean seventh-grade performance and the difference between that and mean eighth-grade performance. That is, countries showing the highest performance at the seventh grade did not necessarily show either the largest or smallest increases in achievement at the eighth grade. Still, in general, countries with high mean performance in the seventh grade also had high mean performance in the eighth grade.

[^17]Table 1.3
Achievement Differences in Mathematics Between Lower and Upper Grades (Seventh and Eighth Grades*)

| Country | Seventh Grade Mean | Eighth Grade Mean | Eighth-Seventh Difference |  |
| :---: | :---: | :---: | :---: | :---: |
| ${ }^{1}$ Lithuania | 428 (3.2) | 477 (3.5) | 49 (4.7) |  |
| France | 492 (3.1) | 538 (2.9) | 46 (4.3) | 1- |
| Norway | 461 (2.8) | 503 (2.2) | 43 (3.6) |  |

## What Are the Differences in Performance Compared to Three Marker Levels of International Mathematics Achievement?

Tables 1.4 and 1.5 portray performance in terms of international levels of achievement for the eighth and seventh grades, respectively. Since the TIMSS achievement tests do not have any pre-specified performance standards, three marker levels were chosen on the basis of the combined performance of all students at a grade level in the study - the Top $10 \%$, the Top Quarter ( $25 \%$ ), and the Top Half ( $50 \%$ ). For example, Table 1.4 shows that $10 \%$ of all eighth graders in countries participating in the TIMSS study achieved at the level of 656 or better. This score point, then, was designated as the marker level for the Top 10\%. Similarly, the Top Quarter marker level was determined as 587 and the Top Half marker level as 509 . At the seventh grade, the three marker levels are: Top $10 \%$ - 619, Top Quarter - 551, and Top Half - 476 .

If every country had the same distribution of high-, medium-, and low-performing students, then each country would be expected to have approximately $10 \%$ of its students reaching the Top $10 \%$ level, $25 \%$ reaching the Top Quarter level, and 50\% reaching the Top Half level. Although no country achieved exactly this pattern at either grade tested, the data in Tables 1.4 and 1.5 indicate that in both grades Ireland came close to the international norm from the perspective of relative percentages of high-performing students. In contrast, at both grades close to half the students in Singapore ( $45 \%$ at the eighth grade and $44 \%$ at the seventh grade) reached the Top $10 \%$ level, about three-fourths ( $74 \%$ and $70 \%$ ) reached the Top Quarter level, and more than $90 \%$ performed at or above the Top Half level ( $94 \%$ and $91 \%$ ).

It can be informative to look at performance at each marker level. For example, the results in Table 1.4 show that students in New Zealand did not quite attain the Top $10 \%$ or Top Quarter levels for the eighth grade, with $6 \%$ and $20 \%$ of the students reaching those levels, respectively. However, performance approximated the marker level for the Top Half (48\%). Achievement in England was nearly identical to that of New Zealand in this regard. In France, achievement fell somewhat short at the Top 10\% level (7\%), approximated the Top Quarter level (26\%), and exceeded the Top Half level (63\%).

## What Are the Gender Differences in Mathematics Achievement?

Tables 1.6 and 1.7, showing the differences in achievement by gender, reveal that, in most countries, girls and boys had approximately the same average mathematics achievement as each other at both grades. However, the differences in achievement that did exist in some countries tended to favor boys rather than girls.

Each of the two tables, the first one for the eighth grade and the second for the seventh grade, presents mean mathematics achievement separately for boys and girls for each country, as well as the difference between the means. The visual representation of the gender difference for each country, shown by a bar, indicates the amount of the difference, whether the direction of the difference favors girls or boys, and whether or not the difference is statistically significant (indicated by a darkened bar). Regardless of their directions, about three-fourths of the differences were not statistically significant, indicating that, for most countries, gender differences in mathematics achievement generally are small or negligible in the middle years of schooling. That is, nearly three-quarters of the differences favoring boys at the eighth grade and more than three-quarters at the seventh grade were not statistically significant. Also, girls had higher mean achievement than boys in nine countries (across both grades), even though those results were not statistically significant either.

From another perspective, however, all the statistically significant differences favored boys rather than girls. At both grades, boys had significantly higher mathematics achievement than girls in Japan, Iran, and Korea. Further, boys outperformed girls at the eighth grade in Spain, Portugal, Denmark, Greece, and Israel, and at the seventh grade in Belgium (French), Switzerland, and England. Also, including those differences that were not statistically significant, the direction at both grades favored boys much more often than girls. A sign test across countries indicates that internationally there is a significant difference in achievement by gender favoring males. The gender differences in mathematics, however, were much less pronounced than those in science. The TIMSS science results for seventh and eighth grades show significant gender differences favoring males to be pervasive across most countries. ${ }^{10}$

## What Are the Differences in Median Performance at Age 13?

For countries where the grades tested contained at least $75 \%$ of the 13 -year-olds, TIMSS estimated the median performance for this age group. Table 1.8 provides this estimate as well as presenting estimates of the distribution of 13 -year-olds across grades. ${ }^{11}$ For many countries, the two grades tested included practically all of their 13-year-olds (nine countries have at least $98 \%$ ), whereas, for some others, there were substantial percentages outside these grades, mostly in the grade below. ${ }^{12}$ For countries included in Table 1.8, Hong Kong, Belgium (French), Hungary, France, Ireland, Latvia (LSS), Spain, Lithuania, Portugal, Austria, Romania, and Thailand had $10 \%$ or more of their 13 -year-olds below the two grades tested.

The median is the point on the mathematics scale that divides the higher-performing $50 \%$ of the students from the lower-performing $50 \%$. Like the mean, the median provides a useful summary statistic on which to compare performance across countries. It is used instead of the mean in this table because it can be reliably estimated even when scores from some members of the population are not available ${ }^{13}$ (that is, those 13 -year-olds outside the tested grades).

Notwithstanding the additional difficulties in calculating the age-based achievement estimates, the results for 13-year-olds appear quite consistent with those obtained for the two grade levels. The relative performance of countries in mathematics achievement on the basis of median performance of 13 -year-olds is quite similar to that based on average eighth-grade and/or seventh-grade performance. Despite some slight differences in relative standings (generally within sampling error), the higherperforming countries in the eighth and seventh grades generally were those with higher-performing 13 -year-olds.
${ }^{11}$ For information about the distribution of 13 -year-olds in all countries, not just those with $75 \%$ coverage, see Table A. 3 in Appendix A.
${ }^{12}$ The number of 13 -year-olds below the lower grade and above the upper grade tested were extrapolated from the estimated distribution of 13 -year-olds in the tested grades.
${ }^{13}$ Because TIMSS sampled students in the two adjacent grades with the most 13 -year-olds within a country, it was possible to estimate the median for the 13 -year-old students when the two tested grades included at least an estimated $75 \%$ of the 13 -year-olds in that country. To compute the median, TIMSS assumed that those 13 -year-old students in the grades below the tested grades would score below the median and those in the grades above the tested grades would score above the median. The percentages assumed to be above and below the median were added to the tails of the distribution before calculating the median using the modified distribution.

Table 1.8

## Median Mathematics Achievement - 13-Year-Old Students Includes Only Countries Where the Grades Tested Contained at Least 75\% of the 13-Year-Olds

## -Chapter 2

## Average Achievement in the Mathematics Conient Areas

Recognizing that important curricular differences exist between and within countries is an important aspect of IEA studies, and TIMSS attempted to measure achievement in different areas within mathematics that would be useful in relating achievement to curriculum. After much deliberation, the mathematics test for the seventh and eighth grades was designed to enable reporting by six content areas. ${ }^{1}$ These six content areas include:

- fractions and number sense
- geometry
- algebra
- data representation, analysis, and probability
- measurement
- proportionality

Following the discussion in this chapter about differences in average achievement for the TIMSS countries across the content areas, Chapter 3 contains further information about the types of items within each content area, including a range of five or six example items within each content area and the percent of correct responses on those items for each of the TIMSS countries.

## How Does Achievement Differ Across Mathematics Content Areas?

As we have seen in Chapter 1, there are substantial differences in achievement among the participating countries on the TIMSS mathematics test. Given that the mathematics test was designed to include items from different curricular areas, it is important to examine whether or not the participating countries have particular strengths and weaknesses in their achievement in these content areas.

This chapter uses an analysis based on the average percent of correct responses to items within each content area to address the question of whether or not countries performed at the same level in each of the content areas as they did on the mathematics test as a whole. Because additional resources and time would have been required to use the more complex IRT scaling methodology that served as the basis for the overall achievement estimates in Chapter 1, TIMSS could not generate scale scores for the six content areas for this report. ${ }^{2}$

[^25]Tables 2.1 and 2.2 provide the average percent of correct responses to items in the different content areas for the eighth- and seventh-grade students, respectively. The countries are listed in order of their average percent correct across all items in the test. As indicated by the numbers of items overall and in each content area, the overall test contains more fractions and number sense items (34\%) and fewer proportionality items ( $7 \%$ ). Thus, countries that did well on the items testing fractions and number sense were more likely to have higher overall scores than those that performed better in proportionality. ${ }^{3}$

The results for the average percent correct across all mathematics items are provided for each country primarily to provide a basis of comparison for performance in each of the content areas. For the purpose of comparing overall achievement between countries, it is preferable to use the results presented in Chapter $1 .{ }^{4}$ It is interesting to note, however, that even though the relative standings of countries differ somewhat from Tables 1.1 and 1.2, the slight differences are well within the limits expected by sampling error and can be attributed to the differences in the methodologies used.

The data in each column show each country's average percent correct for items in that content area and the international average across all countries for the content area (shown as the last entry in the column). Looking down each of the columns, in turn, two findings become apparent. First, the countries that did well on the overall test generally did well in each of the various content areas, and those that did poorly overall also tended to do so in each of the content areas. There are differences between the relative standing of countries within each of the content areas and their overall standing, but these differences are small when sampling error is considered.

Second, the international averages show that the different content areas in the TIMSS test were not equally difficult for the students taking the test. Data representation, analysis, and probability was the least difficult content area for both grades. On average, the items in this content area were answered correctly by $62 \%$ of the eighth-graders and $57 \%$ of the seventh-graders across countries. Internationally, the proportionality items (international averages of $45 \%$ at eighth grade and $40 \%$ at seventh grade) were the most difficult items for the students at both grades.

It is important to keep these differences in average difficulty in mind when reading across the rows of the table. These differences mean that for many countries, students will appear to have higher than average performance in data representation, analysis, and probability and lower than average performance in proportionality. For example, even the eighth-grade students in Singapore, who performed above the international average for the area of proportionality by a substantial margin, still

[^26]

[^27]SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.
performed somewhat less well in this area than they did on the test as a whole. That is, simply comparing performance across the rows gives an unclear picture of each country's relative performance across the content areas because the differing difficulty of the items has not been taken into account.

To facilitate more meaningful comparisons across rows, TIMSS has developed profiles of relative performance, which are shown for both grades in Table 2.3. These profiles are designed to show whether participating countries performed better or worse in some content areas than they did on the test as a whole, after adjusting for the differing difficulty of the items in each of the content areas. ${ }^{5}$ An up-arrow indicates that a country did significantly better in a content area than it did on the test as a whole, a down-arrow indicates significantly lower performance, and a circle indicates that the country's performance in a content area is not very different from its performance on the test as a whole. ${ }^{6}$

The profiles in Table 2.3 reveal that many countries performed relatively better or worse in several content areas than they did overall. Except in the Netherlands at the seventh grade, each country had at least one content area in which it did relatively better or worse than it did on average. Although countries that did well in one content area tended to do well in others, there were still significant performance differences by content area among countries. For example, countries that performed relatively better in fractions and number sense often were different from those that performed relatively better in geometry and algebra. Also, although there were some differences between the two grades, relative performance tended to be similar at both the seventh and eighth grades.

Singapore, Belgium (Flemish), Hungary, Ireland, Switzerland, Canada, the United States, and Germany all performed relatively better in fractions and number sense than they did on the test as a whole at both grades. The countries performing relatively better in geometry at both grades included Japan, Korea, Hong Kong, the Russian Federation, France, Latvia (LSS), Iran, Romania, and Thailand. In algebra, the countries performing relatively better at both grades were Japan, Hong Kong, the Czech Republic, the Slovak Republic, Hungary, the Russian Federation, Spain, Cyprus, Romania, and South Africa. This is consistent with the existence of differing curricular patterns and

[^28]approaches among countries as discussed in the curriculum analysis report, Many Visions, Many Aims: A Cross-National Investigation of Curricular Intentions in School Mathematics. ${ }^{7}$ This report indicates that a number of the Pacific Rim and Eastern European countries focus on geometry and algebra during the middle-school years.

${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).

## What Are the Increases in Achievement Between the Lower and Upper Grades?

Figure 2.1, which profiles the increases in average percent correct between the seventh and eighth grade for each country across content areas, also reflects these curricular differences. The figure portrays the degree of the increase in mathematics achievement overall as well as the increase in achievement for each of the six content areas. The dashed line indicates the overall increase, for ease in comparing the growth within content areas against the growth in performance overall. The results are presented in descending order by the amount of overall increase between the grades, beginning with Lithuania, France, and Norway, all three of which showed the greatest increases (about 10\%).

The results show that the degree of increase across the different content areas was uneven in most countries, generally reflecting a greater emphasis in the curriculum on some areas compared to others during the eighth grade. There were several countries, however, where the increases in the content areas were similar to the overall betweengrade increase across most content areas, including Latvia (LSS), the United States, Korea, Hong Kong, and Denmark, for example.

In general, performance in geometry and algebra showed the largest growth between the seventh and eighth grades. This is most noticeable in geometry for Lithuania and Switzerland. France, Norway, Switzerland, Spain, the Slovak Republic, and Hungary were among those countries showing higher-than-average between-grade increases in algebra. In general, the growth in data representation, analysis, and probability was quite similar or somewhat below the average between-grade increase. Fractions and number sense often showed a smaller-than-average increase compared to that overall, presumably because this content area was no longer emphasized in the middle-school curriculum in many countries. The smaller-than-average increases in the area of proportionality most likely reflect a general lack of special emphasis in this area.

[^30]Figure 2.1 (Continued-3)
Difference in Average Percent Correct Between Lower and Upper Grades (Seventh and Eighth Grades*) Overall and in Mathematics Content Areas

[^31]
## What Are the Gender Differences in Achievement for the Content Areas?

Tables 2.4 and 2.5 indicate few statistically significant gender differences in achievement by content areas. However, the reduced number of gender differences in performance overall compared to the differences in scale scores discussed in Chapter 1 reinforces the idea of less precision in the percent-correct metric. Still, the findings are consistent - few gender differences, but the differences that do exist tended to favor boys. The exception from the pattern occurred in algebra, where, if anything, girls tended to have the advantage.

In fractions and number sense, the gender differences at both grades were minimal in all countries except Korea, where the eighth-grade boys showed a significant advantage. Similarly, boys and girls performed about the same in the content area of geometry at both grades. The exception was Greece, where the eighth-grade boys performed significantly better than the girls did.

In algebra, no gender differences were statistically significant at the eighth grade, but the results appeared to be more diverse, with girls having slightly higher averages (3 percentage points or more) than boys in a dozen or so countries. At the seventh grade, the pattern was similar, and girls performed significantly better than boys in Canada and Lithuania.

Boys and girls performed similarly on the items in the content area of data representation, analysis, and probability, except in a few countries where boys appeared to outperform girls. The only significant differences were in Korea, where the boys outperformed the girls at both grades.

The most differences in performance by gender were found in measurement where boys had higher achievement than did girls in a number of countries. At the eighth grade, the differences were statistically significant in Korea, Portugal, Spain, and Denmark. At the seventh grade, a significant difference was found in Iran.

Results in the area of proportionality paralleled those in fractions and number sense, with boys and girls performing similarly in most countries. There were no significant gender differences at the eighth grade. At the seventh grade, boys performed better than girls in Iceland, Japan, and Denmark.

In some respects, the TIMSS findings about gender differences parallel those found in the Second International Mathematics Study (SIMS) conducted in 1980-82. ${ }^{8}$ Based on testing the grade with the most 13 -year-old students, SIMS results indicated that girls were more likely to achieve better than boys in computation-level arithmetic, whole numbers, estimation and approximation, and algebra. Boys tended to be better in measurement, geometry, and proportional thinking. Even though the SIMS gender differences in arithmetic, geometry, and proportional thinking did not appear in the

[^32]TIMSS results, the patterns of higher achievement for girls in algebra and of higher achievement for boys in measurement are consistent from the second to the third IEA mathematics studies. In the SIMS report, the authors suggested that "boys' familiarity with the application of, and relationships between, units of measure may well be related to their link with traditionally male occupations, hobbies, and pastimes, and the gender differences for this subtest may underline the effect that experience can have on learning." This potential explanation for boys' advantage in the content area of measurement may also be worth considering in the context of the TIMSS data.

## -Chapter 3

Performance on Items Within Each Mathematics Content Area

This chapter presents five or six example items within each of the mathematics content areas, including the performance on each of the items for each of the TIMSS countries. The example items were selected to illustrate the different topics covered within each content area as well as the different performance expectations. The items also were chosen to show the range of item formats used within each area. To provide some sense of what types of items were answered correctly by higher-performing as compared to lower-performing students, the items show a range of difficulty within each content area. Finally, it should be noted that all these items and others are released for use by the public. ${ }^{1}$

The presentation for each of the content areas begins with a brief description of the major topics included in the content area and a discussion of student performance in that content area. The discussion is followed by a table showing the percent correct on the example items for each of the TIMSS countries at both the seventh and eighth grades. After the table showing the country-by-country results, there is a figure relating achievement on each of the example items to performance on the TIMSS international mathematics scale. This "difficulty map" provides a pictorial representation of achievement on the scale in relation to achievement on the items. Following the difficulty map, each item is presented in its entirety. The correct answer is circled for multiple-choice items and shown in the answer space for short-answer items. For extended-response questions, the answer shown exemplifies the type of student responses that were given full credit. All of the responses shown have been reproduced from students' actual test booklets.

## What Have Students Learned About Fractions and Number Sense?

The category of fractions and number sense included operations and problem solving with whole numbers, fractions, decimals, and percentages as well as estimating and rounding. Table 3.1 presents the percent of correct responses given by students in each of the TIMSS countries to each of the six example items presented within this category.

Figure 3.1 presents a pictorial representation of the relationship between performance on the TIMSS international mathematics scale and achievement on the six example items for fractions and number sense. ${ }^{2}$ The international achievement on each example item is indicated both by the average percent correct across all countries at the seventh and eighth grades and by the international mathematics scale value, or

| Israel | - | 95 (1.4) | - | 80 (3.1) | - | 59 (3.3) |
| Kuwait | - | 52 (3.5) | - | 37 (5.7) | - | 30 (4.6) |

*Seventh and eighth grades in most countries; See Table 2 for information about the grades tested in each country.
${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below $65 \%$, Latvia is annotated LSS for Latvian Speaking Schools only.
${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
A dash (-) indicates data are not available. Israel and Kuwait did not test at the seventh grade.

[^35]International Difficulty Map for Fractions and Number Sense Example Items Lower and Upper Grades (Seventh and Eighth Grades*)

[^36]item difficulty level, for each item. Since the scale was developed based on the performance of students at both grades in all countries, the international scale values apply to both grades and to all countries.

For the figure, the item results have been placed on the scale at the point where students at that level were more likely than not ( $65 \%$ probability) to answer the question correctly. For example, students scoring at or above 546 on the scale were likely to provide a correct response to the rounding item about the dolphin's actual weight (Example Item 4), and those scoring at or above 610 were likely to have responded correctly to the problem about rate of fuel consumption (Example Item 5). Considering that the international average on the scale was 513 at the eighth grade, however, students achieving at about the level of the international average were unlikely to have answered Example Item 5 (or Example Item 6 about percent increases) correctly. These results, however, varied dramatically by country. Eighth-grade students in Singapore, whose mean achievement was 643 , had relatively high probabilities of answering all but the most difficult fractions and number sense items correctly. Indeed, this is borne out by Singapore's average percent correct of $79 \%$ in this content area at the eighth grade.

The six example items are presented in their entirety beginning on the next page. Example Item 1 is a subtraction problem with whole numbers that requires regrouping (borrowing). The international averages for the percent correct ( $86 \%$ for both grades) indicate that most seventh and eighth graders were successful on this item. In general, the lack of variation in performance between grades and across countries suggest that students in most countries have developed a grasp of how to solve this type of problem prior to the seventh and eighth grades.

Example Item 2 about understanding the relative size of fractions required students to provide their response, rather than select an answer in the multiple-choice format. On average, approximately three-fourths of both the seventh and eighth graders ( $74 \%$ and $75 \%$, respectively) provided a correct response (any fraction larger than two-sevenths). Again, there were few differences in performance across countries or grade levels. With the exception of Iran, Kuwait, and South Africa, at least $60 \%$ of the seventh and eighth graders in each of the participating countries responded correctly.

Internationally, on average, about two-thirds of the students at seventh and eighth grades ( $62 \%$ and $66 \%$ ) correctly interpreted the information about scale provided on the map shown in Example Item 3. As might be expected, the eighth graders performed better than seventh graders in many countries. Notwithstanding the between-grade increases, in all but a few cases, the majority of seventh graders answered the question correctly.

Averaged across countries, Example Item 4, which required students to demonstrate their understanding of rounded values, was answered correctly by approximately half the students at seventh and eighth grades ( $47 \%$ and $53 \%$ ). Any value within the range of 165 through 174 was coded as a correct response. On this item, however, there was considerable variation in performance across countries. For example, 80\% or more of the students at one or both grades in the Czech Republic, Korea, Singapore,

Sweden, and Australia provided a correct answer to this question. In contrast, fewer than $20 \%$ of the students did so at one or both grades in Cyprus, Iran, Spain, Colombia, Kuwait, and South Africa.

Multi-step problems such as the one shown in Example Item 5 were difficult for students around the world. On average, $35 \%$ of the seventh-grade students and $39 \%$ of those in eighth grade responded correctly. The most prevalent mistake was to select the amount of fuel used on the trip (option C) rather than the amount of fuel remaining in the tank.

The international averages for Example Item 6 indicate that working with percentages is a challenge for students in most countries. Only about one-fourth of the students at seventh and eighth grades $(23 \%$ and $28 \%)$ responded correctly to this multiplechoice item. Singapore posted by far the best performance on this item ( $69 \%$ and $78 \%$ correct at grades 7 and 8), with Hong Kong having the next highest achievement ( $47 \%$ and $54 \%$ correct).

EXAMPLE ITEM 1
Fractions \& Number Sense
Subtraction problem with whole numbers
Subtract:

```
6000
``` \(-2369\)
A. 4369
B. 3742
(C.) 3631
D. 3531

Performance Category: Performing Routine Procedures

EXAMPLE ITEM 2
Fractions \& Number Sense
Write a larger fraction
Write a fraction that is larger than \(\frac{2}{7}\).

Answer: \(\qquad\)
Performance Category: Knowing

\section*{EXAMPLE ITEM 3 \\ Fractions \& Number Sense}

\section*{Distance on map}

One centimeter on the map represents 8 kilometers on the land.

About how far apart are Oxford and Smithville on the land?
A. 4 km
B. 16 km
(C. 35 km
D. 50 km
Performance Category: Using Complex Procedures

EXAMPLE ITEM 4
Fractions \& Number Sense

\section*{Actual weight from rounded value}

Rounded to the nearest 10 kg the weight of a dolphin was reported as 170 kg
Write down a weight that might have been the actual weight of the dolphin.

Answer: \(\qquad\) Performance Category: Using Complex Procedures

\section*{EXAMPLE ITEM 5}

Fractions \& Number Sense

\section*{Rate of fuel consumption}

A car has a fuel tank that holds 35 L of fuel. The car consumes 7.5 L of fuel for each 100 km driven. A trip of 250 km was started with a full tank of fuel. How much fuel remained in the tank at the end of the trip?
(A. 16.25 L
B. \(\quad 17.65 \mathrm{~L}\)
C. \(\quad 18.75 \mathrm{~L}\)
D. \(\quad 23.75 \mathrm{~L}\)

Performance Category: Solving Problems

EXAMPLE ITEM 6
Fractions \& Number Sense

\section*{Percent increase in price}

If the price of a can of beans is raised from 60 cents to 75 cents, what is the percent increase in the price?
A. \(15 \%\)
B. \(20 \%\)
C. \(25 \%\)
D. \(30 \%\)

\section*{What Have Students Learned About Geometry?}

There was perhaps more variation in the geometry curriculum across countries than in any of the other mathematics content areas. The TIMSS geometry items required students to visualize geometric figures and to demonstrate their understanding of the properties of geometric figures. The concepts measured included symmetry, congruence, and similarity. Table 3.2 presents the results for the example items in geometry.
Figure 3.2 presents the international difficulty map for the example items in geometry. Considering the international mean on the mathematics scale of 513 (for eighth grade), it can be seen that students performing above the mean were much more likely to understand the properties of geometric figures.

The range of student understanding in geometry is demonstrated by their performance on Example Items 7 through 12. Example Item 7 assessed spatial visualization skills, and Example Item 8 lines of symmetry. Although the content differed, internationally about two-thirds of the seventh- and eighth-grade students answered these questions correctly (Example Item 7-63\% and 67\%, Example Item 8-63\% and 66\%). Some countries did much better on these items than others. At the eighth grade, \(80 \%\) or more students answered Example Item 7 correctly in Belgium (Flemish), the Czech Republic, Iceland, Japan, Latvia (LSS), the Slovak Republic, Switzerland, and Austria. This compares to fewer than half answering correctly in Cyprus, Iran, Colombia, South Africa, and Kuwait. Similarly, a number of countries were at about the \(80 \%\) level on Example Item 8, while a few were at or below the level of \(50 \%\) correct responses.

On average, Example Item 9, requiring understanding of ratio and perimeter, was answered correctly by \(50 \%\) of the students at seventh grade and \(56 \%\) at the eighth grade. In general, these international results reflect increases in achievement between the two grades shown in many countries and seem consistent with a curricular emphasis in geometry during the eighth grade.

The majority of students in many countries had difficulties with Example Item 10 on the properties of parallelograms. The international averages for the percents correct were \(44 \%\) and \(49 \%\) at the seventh and eighth grades, respectively. Only in Flemish-speaking Belgium ( \(79 \%\) ), Korea, ( \(79 \%\) ), and Bulgaria ( \(78 \%\) ) did more than three-fourths of the eighth-grade students answer this question correctly.

When given its coordinates and asked about another point on a line (Example Item 11), students showed great variation in performance from country to country. On average, the results were low at both seventh and eighth grades ( \(38 \%\) and \(41 \%\) ). In the Netherlands, the top-performing country on this item, the corresponding figures were \(62 \%\) and \(66 \%\). Students in England ( \(58 \%\) and \(55 \%\) ) and Scotland ( \(54 \%\) and 52\%) also performed relatively well compared to their counterparts in other countries.

One of the most difficult geometry items assessed understanding of the properties of congruent triangles (Example Item 12). Internationally, the average percent of correct responses was \(27 \%\) for the seventh grade and \(35 \%\) for the eighth grade. Still, about two-thirds of the eighth-grade students responded correctly in Japan, Korea, and Singapore.

}

\section*{International Difficulty Map for Geometry Example Items} Lower and Upper Grades (Seventh and Eighth Grades*)

\footnotetext{
*Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
NOTE: Each item was placed onto the TIMSS international mathematics scale based on students' performance in both grades. Items are shown at the point on the scale where students with that level of proficiency had a 65 percent probability of providing a correct response.
}

Example Item 8 Geometry

Lines of symmetry
Which shows all of the lines of symmetry for a rectangle?

B.

Performance Category: Knowing

\section*{EXAMPLE ITEM 9} GeOMETRY

\section*{Ratio of side length to perimeter}

What is the ratio of the length of a side of a square to its perimeter?
A. \(\frac{1}{1}\)
B. \(\frac{1}{2}\)
C. \(\frac{1}{3}\)

Performance Category: Solving Problems

EXAMPLE ITEM 10
Geometry

\section*{Properties of parallelograms}

A quadrilateral MUST be a parallelogram if it has
A. one pair of adjacent sides equal
B. one pair of parallel sides
C. a diagonal as axis of symmetry
D. two adjacent angles equal
(E.)
two pairs of parallel sides

Performance Category: Knowing

\section*{EXAMPLE ITEM 11 Geometry}

\section*{Point on a line}

A straight line on a graph passes through the points \((3,2)\) and \((4,4)\). Which of these points also lies on the line?
A. \((1,1)\)
B. \((2,4)\)
(C.) \((5,6)\)
D. \((6,3)\)
E. \((6,5)\)

Example ITEM 12
GEOMETRY

\section*{Congruent triangles}

These triangles are congruent. The measures of some of the sides and angles of the triangles are shown.

What is the value of \(x\) ?

D. 73
E. 75

Performance Category: Performing Routine Procedures

\section*{What Have Students Learned About Algebra?}

To demonstrate their understanding of algebraic concepts, students were asked to solve a variety of problems involving patterns, relations, expressions, and equations. The country-by-country results for the example algebra items are presented in Table 3.3. Figure 3.3, showing the relationship between performance on these items and performance on the mathematics scale, suggests that even some of the eighth graders in most countries had considerable difficulty with all but the most straightforward algebra questions. Questions involving expressions and equations were most likely to be answered correctly by only the higher-performing students (students achieving approximately at or above the eighth-grade mean of 513).

Example Items 13 through 17 illustrate the range of student performance. As shown by Example Item 13, the easiest items measured concepts underlying algebra such as the ability to detect patterns. In most countries, students performed very well on this item at both grades ( \(87 \%\) and \(90 \%\) correct responses averaged across countries).

Example Item 14 is a two-part item requiring students to supply their answers. In the first part of the item, students generally were able to establish the number of small triangles in the figures ( \(72 \%\) and \(75 \%\) average correct at the seventh and eighth grades, respectively). Of course, finding the answers of 4 and 9 could have been accomplished by actually counting the small triangles. In contrast, very few students demonstrated their ability to extend the pattern and determine that 64 small triangles would be needed for the 8th figure (international averages of \(18 \%\) and \(26 \%\) ). In only Japan ( \(52 \%\) ) and Singapore ( \(50 \%\) ) did at least half the eighth-grade students provide a correct response to this question.

Example Items 15, 16, and 17 required students to work with algebraic equations and expressions. The international results for Example Item 15 indicate that students in most countries were relatively successful in solving a simple linear equation for \(x\) (on average, \(62 \%\) and \(72 \%\) correct at the seventh and eighth grades). As shown by the data for Example Item 16, they had more difficulty recognizing that \(m+m+m+m\) was equivalent to \(4 m\) (international averages of \(47 \%\) and \(58 \%\) ). It should be noted, however, that three-fourths or more of the eighth-grade students answered this question correctly in the Czech Republic, Hong Kong, Japan, the Russian Federation, Singapore, the Slovak Republic, and Slovenia. Considering the performance on Example Item 16, it is not surprising that students had even more difficulty identifying the correct expression to represent the number of Clarissa's hats as required by Example Item 17. International performance on this item averaged \(37 \%\) at the seventh grade and \(47 \%\) at the eighth grade.

International Difficulty Map for Algebra Example Items - Lower and Upper Grades (Seventh and Eighth Grades*)

\section*{EXAMPLE ITEM 13}

Algebra

\section*{Shapes in a pattern}

These shapes are arranged in a pattern.
\(O \triangle O O \triangle \triangle O O O \triangle \triangle \triangle\)
Which set of shapes is arranged in the same pattern?
A.

B. \(\square \star \square \square \star \square \square \square \star \square \square \square \square\)
(C.) \(\star \square \star \star \square \square \star \star \star \square \square \square\)
D. \(\square \square \star \star \square \star \square \square \star \star \square \star\)

Performance Category: Knowing

\section*{EXAMPLE ITEM 14}

Algebra

\section*{Sequence of triangles}

Here is a sequence of three similar triangles. All of the small triangles are congruent.

Figure 1

Figure 2

Figure 3
a. Complete the chart by finding how many small triangles make up each figure.
\begin{tabular}{|c|c|}
\hline Figure & \begin{tabular}{c} 
Number of \\
small triangles
\end{tabular} \\
\hline \hline 1 & 1 \\
\hline 2 & 4 \\
\hline 3 & 9 \\
\hline
\end{tabular}
b. The sequence of similar triangles is extended to the 8th Figure.

How many small triangles would be needed for Figure 8?

\[
64 \text { small triangls }
\]

\section*{EXAMPLE ITEM 15 \\ Algebra}

\section*{Solve linear equation for \(x\)}

If \(3(x+5)=30\), then \(x=\)
A. 2
(B.) 5
C. 10
D. 95

Example ITEM 16
AlGebra

\section*{Equivalent algebraic expressions}

If \(m\) represents a positive number, which of these is equivalent to \(m+m+m+m\) ?
A. \(m+4\)
(B.) \(4 m\)
C. \(m^{4}\)
D. \(4(m+1)\)

Performance Category:Knowing

\section*{ExAMPLE ITEM 17}

Algebra

\section*{Expression representing number of hats}

Juan has 5 fewer hats than Maria, and Clarissa has 3 times as many hats as Juan. If Maria has \(n\) hats, which of these represents the number of hats that Clarissa has?
A. \(5-3 n\)
B. \(3 n\)
C. \(n-5\)
D. \(3 n-5\)
(E.) \(3(n-5)\)

\section*{What Have Students Learned About Data Representation, Analysis, and Probablity?}

As illustrated by Example Items 18 through 23, the types of items in this content area required students to represent and analyze data using charts, tables, and graphs and to demonstrate their understanding of basic concepts underlying uncertainty and probability. The results for the example items are presented in Table 3.4. As shown in Figure 3.4, the international difficulty map for data representation, analysis, and probability indicates that the higher performing students were more likely to demonstrate the ability to apply concepts and integrate their understandings.

Example Item 18 asked students to read a chart of daily temperatures. Performance on reading the chart of temperatures was high in nearly all countries (international averages of \(85 \%\) and \(87 \%\) ). Performance also was relatively high on Example Item 19 which required students to complete a pictograph (international averages of \(79 \%\) and \(81 \%\) ).

Example Item 21, requiring students to read a line graph, posed a greater challenge for students in many countries. On average, \(51 \%\) of the students at the seventh grade across countries and \(58 \%\) at the eighth grade answered this question correctly. There were large differences in performance among countries. At the eighth grade, performance at \(75 \%\) correct or better was achieved in Flemish-speaking Belgium (82\%), France (81\%), Japan ( \(75 \%\) ), Switzerland ( \(77 \%\) ), the Netherlands ( \(76 \%\) ), and Denmark ( \(75 \%\) ). Performance below \(45 \%\) occurred in Cyprus (40\%), Iran (25\%), Colombia (20\%), Romania (36\%), South Africa (17\%), and Kuwait (24\%).

Example Items 20 and 22 assessed the area of probability. In general, students appeared to understand that the probability of picking the one red marble was highest for the fewest number of marbles (Example Item 20). The international averages were 73\% and \(76 \%\) at the seventh and eighth grades, respectively. Eighty-five percent or more of the students at both grades answered this question correctly in Belgium (Flemish), Canada, Hong Kong, Korea, and the Netherlands. In contrast, asking students to integrate their understanding of both cubes and probability proved to be more difficult for them (Example Item 22). The international averages of correct responses were \(41 \%\) at the seventh grade and \(47 \%\) at the eighth grade. Although the eighth-grade students performed quite well in Singapore ( \(88 \%\) ) and two-thirds or more answered correctly in Flemish-speaking Belgium (68\%), Hong Kong (72\%), Japan (75\%), and Korea ( \(68 \%\) ), performance fell below \(40 \%\) correct in a number of countries.

Example Item 23 required students to apply their mathematics understanding to an everyday situation - that of extracting and using appropriate information from a newspaper advertisement to determine which office space had the lower rent. Students were asked to show their work. Although the scoring approach provided information about partial solutions to the problem, the results reported herein for each country are for those students receiving complete credit for the item. That is, students indicated that Building A had the lower price and showed accurate computations to support this conclusion. Performance was quite low in most of the countries. Only in Singapore ( \(55 \%\) ) did more than half the eighth-grade students provide a complete solution to this problem, although performance in Japan (47\%) and Korea (50\%) also was higher than in other countries.

\footnotetext{
*Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
NOTE: Each item was placed onto the TIMSS international mathematics scale based on students' performance in both grades. Items are shown at the point on the scale where students with that level of proficiency had a 65 percent probability of providing a correct response.
}

\section*{Example Item 18}

\section*{Data Representation, Analysis \& Probability}

\section*{Highest temperature on chart}

This chart shows temperature readings made at different times on four days.
\begin{tabular}{||l|c|c|c|c|c|}
\hline \hline \multicolumn{7}{|c|}{ TEMPERATURES } \\
\hline & 6 a.m. & 9 a.m. & Noon & 3 p.m. & 8 p.m. \\
\hline Monday & \(15^{\circ}\) & \(17^{\circ}\) & \(20^{\circ}\) & \(21^{\circ}\) & \(19^{\circ}\) \\
\hline Tuesday & \(15^{\circ}\) & \(15^{\circ}\) & \(15^{\circ}\) & \(10^{\circ}\) & \(9^{\circ}\) \\
\hline Wednesday & \(8^{\circ}\) & \(10^{\circ}\) & \(14^{\circ}\) & \(13^{\circ}\) & \(15^{\circ}\) \\
\hline Thursday & \(8^{\circ}\) & \(11^{\circ}\) & \(14^{\circ}\) & \(17^{\circ}\) & \(20^{\circ}\) \\
\hline
\end{tabular}

When was the highest temperature recorded?
A. Noon on Monday
B. 3 p.m. on Monday
C. Noon on Tuesday
D. 3 p.m. on Wednesday

\section*{Example ITEM 19 \\ Data Representation, Analysis \& Probability}

Pictograph of number of students
The table shows the number of students in the 7th and 8th grades in a given school.
\begin{tabular}{|c|c|}
\hline Grade & Number of Students \\
\hline 7 & 60 \\
\hline 8 & 55 \\
\hline
\end{tabular}

Complete the Grade 8 row in the pictograph below to represent the number of students in each grade.
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{One represents 10 students} \\
\hline Grade 7 & \(\bigcirc \bigcirc \bigcirc \bigcirc \bigcirc\) \\
\hline Grade 8 & \(\bigcirc(\otimes) \otimes\) () \\
\hline
\end{tabular}

\footnotetext{
Performance Category: Using Complex Procedures
}

\section*{EXAMPLE ITEM 20}

Data Representation, Analysis \& Probability

\section*{Chance of picking red marble}

There is only one red marble in each of these bags.

1000 marbles
Without looking in the bags, you are to pick a marble out of one of the bags. Which bag would give you the greatest chance of picking the red marble?
A. The bag with 10 marbles
B. The bag with 100 marbles
C. The bag with 1000 marbles
D. All bags would give the same chance.

\section*{EXAMPLE Item 21 \\ Data Representation, Analysis \& Probablity}

\section*{Speed of car from graph}

The graph shows the distance traveled before coming to a stop after the brakes are applied for a typical car traveling at different speeds.

A car traveling on a highway stopped 30 m after the brakes were applied. About how fast was the car traveling?
A. 48 km per hour
(B.) 55 km per hour
C. \(\quad 70 \mathrm{~km}\) per hour
D. 160 km per hour

Performance Category: Solving Problems

\section*{EXAMPLE ITEM 22 \\ Data Representation, Analysis \& Probability}

\section*{Number of red cube faces}

Each of the six faces of a certain cube is painted either red or blue. When the cube is tossed, the probability of the cube landing with a red face up is \(\frac{2}{3}\). How many faces are red?
A. One
B. Two
C. Three
(D.) Four
E. Five

Performance Category: Solving Problems

\section*{EXAMPLE Item 23 \\ Data Representation, Analysis \& Probability}

Price of renting office space
The following two advertisements appeared in a newspaper in a country where the units of currency are zeds.
\begin{tabular}{|c|}
\hline BUILDING A \\
Office space available \\
\(85-95\) square meters \\
475 zeds per month \\
\(100-120\) square meters \\
800 zeds per month \\
\hline
\end{tabular}

If a company is interested in renting an office of 110 square meters in that country for a year, at which office building, A or B, should they rent the office in order to get the lower price? Show your work.

Price of Renting in Building \(B=110 \times 90\)
\(\therefore 9600<9900\)
\[
\begin{aligned}
\therefore \text { They should rent the office at Building } A \text { in } \\
\text { order to get the lower pine. }
\end{aligned}
\]

\section*{What Have Students Learned About Measurement?}

The measurement items focused on students' understanding of units of length, weight, time, area, and volume as well as on interpreting scales of measures. Table 3.5 contains the percent-correct results for the example items in measurement, numbered Example Items 24 through 29. The international difficulty map for the measurement items (Figure 3.5) indicates that only the students with higher-than-average mathematics scores internationally were likely to demonstrate an ability to use measurement skills in situations involving several steps.

A more detailed look at performance on the example items suggests that students in many countries had a solid grasp of a variety of measuring units and how to interpret them. Students in most countries were able to read the weight shown on the scale (Example Item 24). The international averages on this item were \(83 \%\) at the seventh grade and \(87 \%\) at the eighth grade. Students also did relatively well on Example

Item 25 about pacing off the width of a room (on average, \(69 \%\) and \(74 \%\) at the seventh and eighth grades). This item required some thought to understand that the longer the paces, the fewer required to cross the room. The most prevalent misconception was to indicate that the greatest number of paces was related to the longest pace.

Example Item 26 required familiarity with the number of degrees in circles or parts of circles to identify the angle closest to 30 degrees. On average, it was answered correctly by \(62 \%\) and \(64 \%\) of the seventh- and eighth-grade students, respectively. For this item, the pattern of increased performance between the grades was fairly inconsistent, with a number of countries having the same or lower performance at the eighth as at the seventh grade.

Internationally, approximately half the students at the seventh and eighth grades (on average, \(49 \%\) and \(52 \%\) ) were able to determine 10.5 cm as the length of the pencil (Example Item 27). Performance was generally consistent across most countries, although at the eighth grade, students did particularly well in Switzerland (73\%), Austria ( \(73 \%\) ), and Germany ( \(72 \%\) ). They had the most difficulty in South Africa (17\%).

Example Item 28 was a two-part task that first required students to actually draw a new rectangle whose length was one and one-half times the length of a given rectangle and whose width was half the width of that rectangle. All correctly drawn and labeled 9 cm by 2 cm rectangles were given full credit. In the second part of the item, students were asked to determine the ratio of the area of the new rectangle to the area of the one shown. In most countries, students had considerable difficulty with the first part of this multifaceted task, and even more trouble with the second part (even though the scoring for full credit permitted correct ratios based on incorrect drawings). On average, just \(24 \%\) of the seventh-grade students and \(31 \%\) of those at eighth grade provided a correct drawing of the new rectangle. In only two countries did at least half the eighth-grade students correctly draw the new rectangle, Korea (54\%) and Austria ( \(51 \%\) ). Fewer than \(20 \%\) were successful in Iceland ( \(18 \%\) ), the United States ( \(16 \%\) ), Colombia ( \(5 \%\) ), South Africa ( \(4 \%\) ), and Kuwait ( \(10 \%\) ). Internationally, the second part of the item was very difficult. On average, just \(6 \%\) and \(10 \%\) of the students at the two grades provided a correct ratio between the newly drawn and given rectangles.

International Difficulty Map for Measurement Example Items Lower and Upper Grades (Seventh and Eighth Grades*)

*Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
NOTE: Each item was placed onto the TIMSS international mathematics scale based on students' performance in both grades. Items are shown at the point on the scale where students with that level of proficiency had a 65 percent probability of providing a correct response.

\section*{EXAMPLE ITEM 25}

Measurement

\section*{Measuring the width of a room}

Four children measured the width of a room by counting how many paces it took them to cross it. The chart shows their measurements.

Who had the longest pace?
A. Stephen
B. Erlane
C. Ana
D. Carlos

EXAMPLE ITEM 26
Measurement

\section*{Angle closest to 30 degrees}

Which of these angles has a measure closest to \(30^{\circ}\) ?

Performance Category: Knowing

EXAMPLE ITEM 27
MEASUREMENT
Approximate length of pencil

Which of these is closest to the length of the pencil in the figure?
A. 9 cm
B. 10.5 cm
C. 12 cm
D. \(\quad 13.5 \mathrm{~cm}\)

Performance Category: Using Complex Procedures

Example Item 28
Measurement
New Rectangle

a. In the space below, draw a new rectangle whose length is one and one half times the length of the rectangle above, and whose width is half the width of the rectangle above. Show the length and width of the new rectangle in centimeters on the figure.

b. What is the ratio of the area of the new rectangle to the area of the first one?

Show your work.
new \(\Delta=18 \mathrm{~cm}^{2} \div 3=6\) or \(\frac{3}{4}\)
old \(\Delta=24 \mathrm{~cm}^{2} \div 3=8\)

\section*{What Have Students Learned About Proportionality?}

A small set (11) of the mathematics items was designed to focus specifically on proportionality concepts and problems. Arguably, these items could have been classified in other content areas, usually fractions and number sense, but the decision was made to analyze them separately because they assess an important kind of mathematical reasoning. Example Items 29 through 33 illustrate these types of questions. The percent of correct responses for each country for the example items are provided in Table 3.6.

As described previously in Chapter 2, this item group was relatively more difficult for students than those for the other content areas. Figure 3.6 shows the extreme difficulty of these items for students. Only those students scoring above 600 on the mathematics scale were likely to answer most of these types of questions correctly.

Example Item 29, the least difficult of the items shown here, was one of the few proportionality items answered correctly by the majority of students in most countries. The item asked about adding 5 boys and 5 girls to a class that was three-fifths girls. On average, \(62 \%\) of the students at seventh grade and \(65 \%\) at eighth grade correctly answered that there would still be more girls than boys in the class.

Despite the overall difficulty encountered by students in this content area, there was an extremely large range in performance across countries. Example Item 32, requiring the students to determine the number of girls in a class of 28 based on the ratio of girls to boys, illustrates the extent of the difference in achievement levels. At the eighth grade, the question was answered correctly by \(92 \%\) of the students in Singapore compared to very few in Colombia (12\%), Greece (13\%), South Africa (9\%), and Kuwait (12\%).

\hline \({ }^{\dagger}\) South Africa & 5 (1.5) & 9 (1.7) & 13 (1.3) & 13 (1.4) \\
\hline Thailand & 37 (2.7) & 48 (2.7) & 36 (2.3) & 39 (2.5) \\
\hline \multicolumn{5}{|l|}{Unapproved Sampling Procedures at Classroom Level and Not Meeting Other Guidelines (See Appendix A for Details):} \\
\hline Israel & - & 22 (3.4) & - & 17 (2.8) \\
\hline Kuwait & - & 12 (3.5) & - & 15 (2.0) \\
\hline
\end{tabular}

\footnotetext{
*Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
\({ }^{\dagger}\) Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
\({ }^{1}\) National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
\({ }^{2}\) National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
A dash ( - indicates data are not available. Israel and Kuwait did not test at the seventh grade.
}

\section*{International Difficulty Map for Proportionality Example Items Lower and Upper Grades (Seventh and Eighth Grades*)}

\footnotetext{
*Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
NOTE: Each item was placed onto the TIMSS international mathematics scale based on students' performance in both grades. Items are shown at the point on the scale where students with that level of proficiency had a 65 percent probability of providing a correct response.
}

\section*{EXAMPLE ITEM 29 \\ Proportionality}

\section*{More boys or girls in class}

Three-fifths of the students in a class are girls. If 5 girls and 5 boys are added to the class, which statement is true of the class?
A) There are more girls than boys.
B. There are the same number of girls as there are boys.
C. There are more boys than girls.
D. You cannot tell whether there are more girls or boys from the information given.

Performance Category: Solving Problems

\section*{Example Item 30 \\ Proportionality}

\section*{Ratio of red paint in mixture}

To mix a certain color of paint, Alana combines 5 liters of red paint, 2 liters of blue paint, and 2 liters of yellow paint. What is the ratio of red paint to the total amount of paint?
A. \(\frac{5}{2}\)
B. \(\frac{9}{4}\)
C. \(\frac{5}{4}\)
(D.) \(\frac{5}{9}\)

Performance Category: Performing Routine Procedures

\section*{EXAMPLE ITEM 31}

\section*{Proportionality}

\section*{Amount paid for portion of items}

Peter bought 70 items and Sue bought 90 items. Each item cost the same and the items cost \(\$ 800\) altogether. How much did Sue pay?
Answer: Sue paid \(\qquad\)
\(1 6 \longdiv { 8 0 0 }\)

90
850
450

Performance Category: Solving Problems

Example Item 32
Proportionality

\section*{Number of girls from boy/girl ratio}

A class has 28 students. The ratio of girls to boys is \(4: 3\). How many girls are in the class?

Answer: \(\qquad\)
Performance Category: Solving Problems

Example Item 33
Proportionality
Missing values in proportionality table
The table shows the values of \(x\) and \(y\), where \(x\) is proportional to \(y\).
\begin{tabular}{|c|c|c|c|}
\hline\(x\) & 3 & 6 & \(P\) \\
\hline\(y\) & 7 & \(Q\) & 35 \\
\hline
\end{tabular}

What are the values of \(P\) and \(Q\) ?
A. \(\quad P=14\) and \(Q=31\)
B. \(\quad P=10\) and \(Q=14\)
C. \(\quad P=10\) and \(Q=31\)
D. \(\quad P=14\) and \(Q=15\)
E. \(P=15\) and \(Q=14\)

\section*{-Chapter 4}

\section*{Students' Backgrounds and Attitudes Towards Mathematics}

To provide an educational context for interpreting the mathematics achievement results, TIMSS collected a full range of descriptive information from students about their backgrounds as well as their activities in and out of school. This chapter presents eighth-grade students' responses to a selected subset of these questions. In an effort to explore the degree to which the students' home and social environment fostered academic development, some of the questions presented herein address the availability of educational resources in the home. Another group of questions is provided to help examine whether or not students typically spend their out-of-school time in ways that support their in-school academic performance. Because students' attitudes and opinions about mathematics reflect what happens in school and their perceptions of the value of mathematics in broader social contexts, results also are described for several questions from the affective domain. More specifically, these questions asked students to express their opinions about the abilities necessary for success in mathematics, provide information about what motivates them to do well in mathematics, and indicate their attitudes towards mathematics.

Student and teacher questionnaire data for two countries are unavailable for this report and thus do not appear in this chapter - Bulgaria and South Africa. Bulgaria had complications with data entry, and South Africa joined the study later than the other countries.

\section*{What Educational Resources Do Students Have in Ther Homes?}

Students specifically were asked about the availability at home of three types of educational resources - a dictionary, a study desk or table for their own use, and a computer. Table 4.1 reveals that in most countries eighth-grade students with all three of these educational study aids had higher mathematics achievement than students who did not have ready access to these study aids. In almost all the countries, nearly all students reported having a dictionary in their homes. There was more variation among countries in the percentages of students reporting their own study desk or table. Of the three study aids, the most variation was in the number of eighth-grade students reporting having a home computer. In several countries, more than \(70 \%\) of students reported having a computer in the home, including the more than \(85 \%\) who so reported in England, the Netherlands, and Scotland. For these three countries, it is likely that these high percentages include computers used for entertainment purposes, such as computer games.

The number of books in the home can be an indicator of a home environment that values literacy, the acquisition of knowledge, and general academic support. Table 4.2 presents eighth-grade students' reports about the number of books in their homes in relation to their achievement on the TIMSS mathematics test. In most countries, the more books students reported in the home, the higher their mathematics

*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
A dash (-) indicates data are not available. A tilde ( \(\sim\) ) indicates insufficient data to report achievement.
achievement. Although the main purpose of the question was to gain some information about the relative importance of academic pursuits in the students' home environments rather than to determine the actual number of books in students' homes, there was a substantial amount of variation from country to country in eighth-grade students' reports about the number of books in their homes. In Colombia, Hong Kong, Iran, Kuwait, Romania, and Thailand, \(40 \%\) or more of the students reported 25 or fewer books in the home. Conversely, \(40 \%\) or more of the students in Australia, Hungary, Latvia (LSS), New Zealand, Norway, and Sweden reported more than 200 books in their homes.

Information about their parents' educational levels was gathered by asking students to indicate the highest level of education completed by their fathers and mothers. Table 4.3 presents the relationship between eighth-grade students' mathematics achievement and their reports of the highest level of education of either parent. Results are presented at three educational levels: finished university, finished upper secondary school but not university, and finished primary school but not upper secondary school. These three educational levels are based on internationally-defined categories, which may not be strictly comparable across countries due to differences in national education systems. Although the majority of countries translated and defined the educational categories used in their questionnaires to be comparable to the internationally-defined levels, some countries used modified response options to conform to their national education systems. Also, for a few countries, the percentages of students responding to this question fell below \(85 \%\). When this happened, the percentages shown in the table are annotated with an " \(r\) " for a response rate of \(70 \%\) to \(84 \%\) or an "s" if the response rate was from \(50 \%\) to \(69 \%\).

Despite the different educational approaches, structures, and organizations across the TIMSS countries, it is clear from the data in Table 4.3 that parents' education is positively related to students' mathematics achievement. In every country, the pattern was for those eighth-grade students whose parents had more education to also be those who had higher achievement in mathematics. Once again, the purpose of this question was not to ascertain precisely the educational levels of students' parents, but to gain further understanding about the relative importance of schooling in their home environments. As indicated by the results, there was variation among countries in the percentages of students reporting that they did not know their parents' educational levels, as well as in the percentages of students reporting that their parents had completed successively higher educational levels. For example, in Canada, Israel, Lithuania, the Russian Federation, and the United States, more than \(30 \%\) of the students reported that at least one of their parents had finished university, and only relatively small percentages (fewer than \(12 \%\) ) reported that they did not know the educational levels of their parents. In contrast, almost all students ( \(90 \%\) or more) in Hong Kong, Iran, Kuwait, Portugal, and Thailand also reported knowing their parents' educational levels, but for these countries, fewer than \(10 \%\) of students reported that either parent had finished university.

\section*{Finished Upper Secondary School² But Not University}

Internationally-Defined Levels: Finished Secondary School or Some Vocational/Technical Education After Secondary School or Some University
Countries with Modified Nationally-Defined Levels:
Austria: Upper-secondary tracks: apprenticeship (Berufsschul-/Lehrabschluß), medium vocational (Handelsschule, Fachschule), higher vocational (HAK, HTL, etc.), or higher academic (Gymnasium, Realgymnasium)
Cyprus: Upper-secondary tracks: academic or vocational/technical or Post-Secondary: Finished college
Denmark: Upper-secondary tracks: academic or general/vocational (gymnasium, hf, htx, hhx) vocational training (erhvervsfaglig uddannelse)
Post-Secondary: Medium-cycle higher education (mellemlang uddannselse)
France: Upper-secondary tracks: BEP (11 grades) or baccalauréat (général, technologique or professionnel; 12 or 13 grades) Post-Secondary: 2 or 3 years study after baccalauréat (BTS, DUT, Licence)
Germany: Upper-secondary tracks: general/academic or apprenticeship/vocational training(Lehrabschluß, Berufsfachschule) Post-Secondary: Higher vocational schools (Fachhochschulabschluß)
Hungary: Upper-secondary tracks: apprenticeship (general + 3 years) or final exam in secondary (general + 4 years)
Sweden: Upper-secondary tracks: academic or vocational (gymnasieutbildning or yrkesinriktad utbildning)
Post-Secondary: Less than 3 years of university studies
Switzerland: Upper-secondary tracks: occupational (apprentissage, école professionnelle), academic (gymnase, baccalauréat, maturité cantonale), or teacher training (école normale, formation d'enseignant) Post-Secondary: Applied science university (haute école professionnelle ou commerciale)

\section*{Finished University}

Germany: & University, Technical University or Pedagogical Institute & Switzerland: & University or insitute of technology \\
Hungary: & University or college diploma & United States: Bachelor's degree at college or university
\end{tabular}

\footnotetext{
\({ }^{1}\) Educational levels were translated and defined in most countries to be comparable to the internationally-defined levels. Countries that used modified response options to conform to their national education systems are indicated to aid in the interpretation of the reporting categories presented in Table 4.3.
2Upper-secondary corresponds to ISCED level 3 tracks terminating after 11 to 13 years in most countries. (Education at a Glance, OECD, 1995) SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.
}

Figure 4.1 shows the definitions of the educational categories used by TIMSS and the modifications made to them by some countries. In several countries, the finished primary school but not upper secondary school category included only a single level corresponding to finishing compulsory education ( 8 to 10 grades) and did not include finishing only primary school. In addition, in Germany, the completion of medium secondary education was considered part of this category, while in Austria, which has an educational system similar to Germany's, the medium-level vocational education was included in the second category reporting upper-secondary education.

The second reporting category (finished upper secondary school but not university) was complicated because, in many countries, particularly in Europe, there are several upper-secondary tracks leading to university or other tertiary institutions as well as vocational/apprenticeship programs. In most countries, finishing upper secondary means completion of 11 to 13 years of education. In some systems, however, the general secondary education may be completed after 9 or 10 years, followed by 2 to 4 years of full- or part-time vocational/apprenticeship training that may be either included as part of the secondary educational system or considered as post-secondary. All of the upper-secondary tracks and any upper-secondary or post-secondary vocational education programs included as response options are combined in the second reporting category.

Several countries also differed in their interpretation of what is included in the category of finished university. For example, degrees obtained from technical institutes and other non-university institutions of higher education are considered equivalent to a university degree in some countries but not in others. Completion of a degree at one of these institutions, therefore, may have been included in either the finished university or the finished upper secondary school but not university categories. In countries such as Canada, New Zealand, Portugal, and the United States, the finished university category includes the completion of the equivalent of a bachelor's degree at either a university, college, or polytechnic, while in Austria and France, this category corresponds to the equivalent of a master's degree received at a university.

\section*{What Are the Academic Expectations of Students, Ther Famlies, and Ther Friends?}

Tables 4.4, 4.5, and 4.6 present eighth-grade students' reports about how they themselves, their mothers, and their friends feel about the importance of doing well in various academic and non-academic activities. The first three questions asked about the degree of agreement with the importance of doing well in the academic subjects of mathematics, science, and language, respectively. In almost every country, nearly all eighth-graders agreed or strongly agreed that it was important to do well in mathematics. The percentages were in the high 90 s for many countries and exceeded \(90 \%\) in all countries except one, and that was Romania, with \(88 \%\) agreement. Similarly, approximately the same high percentages of students were in agreement with the importance of doing well in language. In many countries, somewhat fewer eighth-grade students agreed with the importance of doing well in science. Still, the percentages were relatively high, ranging from more than \(90 \%\) agreement in a number of countries to a low of \(68 \%\) in Switzerland and \(72 \%\) in Germany.

For the most part, eighth-grade students indicated that their mothers' opinions about the importance of these academic activities corresponded very closely to their own feelings. In contrast, however, students reported that their friends were not in as much agreement about the importance of academic success. Although students' friends purportedly were in general agreement with the importance of doing well in mathematics, the percentages were generally in the 80s rather than the 90 s . According to students, their friends were in the lowest degree of agreement about doing well in mathematics in Germany and Sweden ( \(70 \%\) for both countries).

As with the students' reports about their own feelings and those of their mothers, students indicated a close alignment in their friends' degree of agreement about the importance of academic success in mathematics and that in language. Apparently, even though the relative importance varies from group to group, students, their mothers, and their friends find it very nearly equally important to do well in mathematics and language. According to students in some countries, however, their friends do not have nearly the same positive feeling about the importance of doing well in science. Countries where fewer than two-thirds of eighth-graders reported that their friends agreed or strongly agreed it was important to do well in science included Australia (64\%), Austria (45\%), the Czech Republic (61\%), France (53\%), Germany (35\%), Hungary (66\%), Iceland (65\%), Ireland (59\%), Israel (56\%), Latvia (LSS) (53\%), Lithuania (55\%), New Zealand (66\%), the Slovak Republic (60\%), Slovenia (56\%), Sweden (61\%), and Switzerland (40\%).

For purposes of comparison, eighth-grade students also were asked about the importance of two non-academic activities - having time to have fun and being good at sports. In most countries, very high percentages of the students (more than \(95 \%\) ) felt it was important to have time to have fun. The percentages in agreement were similar to those agreeing that it was important to do well in mathematics and language. Generally, there was less agreement about the importance of being good at sports which was rather similar to the level of agreement about the importance of doing well in science.

It needs to be emphasized, however, that the relative rankings given to the five activities by students varied from country to country.

In nearly all countries, \(80 \%\) or more of the eighth-grade students reported that their mothers agreed that it was important to have time to have fun. The exceptions were Hong Kong (74\%), Iran (79\%), Korea (58\%), Kuwait (63\%), and Singapore (79\%), where students reported from \(8 \%\) to \(29 \%\) lower agreement for their mothers than for themselves. According to students, their mothers give a moderate to high degree of support to the importance of being good at sports. In nearly all countries, the percentages of students' reporting such agreement were in the 70 s , 80 s , and 90 s , except in Austria (56\%), Germany (48\%), Kuwait (69\%), the Netherlands (63\%), and Switzerland (59\%).

As might be anticipated, students reported that most of their friends agreed that it was important to have fun - more than \(90 \%\) in all countries except \(\operatorname{Iran}(87 \%)\), Korea (88\%), Kuwait (77\%), and Romania (86\%). Internationally, eighth-graders reported that their friends generally were in moderate agreement that it was important to do well in sports. The percentages of their friends' agreement as reported by students ranged from a low of \(64 \%\) in Germany to a high of \(96 \%\) in Colombia.

\section*{How Do Students Spend Ther Out-of-School Time During the School Week?}

Even though education may be thought to be the dominant activity of school-aged children, young people actually spend much more of their time outside of school. Some of this out-of-school time is spent at furthering academic development - for example, in studying or doing homework in school subjects. Table 4.7 presents eighth-grade students' reports about the average number of hours per day they spend studying or doing homework in mathematics, science, and other subjects. Students in many countries reported spending roughly an hour per day studying mathematics. Eighth-graders in the Czech Republic, Denmark, Germany, the Netherlands, and Scotland were at the lower end of the range, reporting an average of about one-half hour per day ( .5 to .6 of an hour). Those in Iran and Romania were at the top end, reporting about two hours mathematics homework per day ( 2.0 and 1.8 hours, respectively). On average, students in nearly all countries reported spending somewhat less time per day studying science.

Participating countries showed some variation in the amount of time students spent doing homework each day across all school subjects. The most common response about the amount of homework done, reported by eighth-graders in about half the countries, was an average of two to three hours per day, but there was a range. Students in Iran, Kuwait, and Romania reported spending the most time on homework, more than five hours per day. Students in the Czech Republic, Denmark, and Scotland reported spending the least amount of time per day on homework, less than two hours.

The students also were asked about a variety of other ways they could spend their time out of school. Eighth-graders were asked about watching television, playing computer games, playing or talking with friends, doing jobs at home, playing sports, and reading books for enjoyment. Their reports about the amount of time spent daily in each of these activities are shown in Table 4.8. Granted, some television programming and some computer games are targeted at developing children's academic abilities, and leisure reading also can be related to higher academic achievement. Still, much fare on television is not educationally related, and eighth-grade students in many countries reported spending nearly as much time each day watching television - an average of two to three hours per day - as they did doing homework. Eighth-graders in many countries also appear to spend several hours per day playing or talking with friends, and nearly two hours playing sports. The time spent on leisure activities is not additive, because students often do these activities simultaneously (e.g., talk with friends and watch television). Nevertheless, it does appear that in most countries at least as much time is spent in these largely non-academic activities as in studying and doing homework, and probably more time.

Table 4.9 shows the relationship between time spent doing homework in all subjects and students' average mathematics achievement. The relationship was curvilinear in many countries, with the highest achievement being associated with a moderate amount of homework per day (one to three hours). This pattern suggests that, compared to their higher-achieving counterparts, the lower-performing students may do less homework, either because they do not do it or because their teachers do not assign it, or more

\hline
\end{tabular}
\({ }^{\top}\) Average hours based on: No Time = 0; Less Than 1 Hour = .5; 1-2 Hours =1.5; 3-5 Hours = 4; More Than 5 Hours = 7 .
*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
A dash (-) indicates data are not available.

homework, perhaps because they need to spend the extra time to keep up academically. In some countries, students doing one hour a day of homework or more had higher average mathematics achievement than students doing less than one hour a day (e.g., Greece, Japan, the Russian Federation, and Spain), although in these countries there was little difference in achievement as the time spent increased from at least one hour to more than three hours. A direct positive relationship between time spent doing homework and mathematics achievement was found in other countries, such as Korea and Romania. The only inverse relationship was noted for Denmark. Clearly, different countries have different policies and practices about assigning homework.

The relationship between mathematics achievement and amount of time spent watching television each day was more consistent across countries than that with doing homework (see Table 4.10). In about half the TIMSS countries, the highest mathematics achievement was associated with watching from one to two hours of television per day. This was the most common response, reflecting from \(33 \%\) to \(54 \%\) of the students for all countries. That watching less than one hour of television per day generally was associated with lower average mathematics achievement than watching one to two hours in many countries most likely has little to do with the influence of television viewing on mathematics achievement. For these students, low television viewing may be a surrogate socio-economic indicator, suggesting something about children's access to television sets across countries. Because students with fewer socio-economic advantages generally perform less well than their counterparts academically, it may be that students who reported less than one hour watching television each day simply do not have television sets in their homes, or come from homes with only one television set where they have less opportunity to spend a lot of time watching their choice of programming.

In general, beyond one to two hours of television viewing per day, the more television eighth-graders reported watching, the lower their mathematics achievement, although there were several countries where students watching three to five hours of television did not have lower achievement than those watching one to two hours. In all countries, however, students watching more than five hours of television per day had the lowest average mathematics achievement. Countries where \(10 \%\) or more of the students reported watching more than five hours of television each day included Colombia, England, Hong Kong, Hungary, Israel, Latvia (LSS), Lithuania, New Zealand, the Russian Federation, Scotland, the Slovak Republic, and the United States.

\section*{How Do Students Perceive Success in Mathematics?}

Table 4.11 presents eighth-grade students' perceptions about doing well in mathematics. In all except four countries, the majority of students agreed or strongly agreed that they did well in mathematics. The four exceptions, where more than \(50 \%\) of the students disagreed or strongly disagreed about doing well, were Hong Kong (62\%), Japan (55\%), Korea ( \(62 \%\) ), and Lithuania ( \(51 \%\) ). Notably, three of those countries were among the very highest performing countries. Countries where \(80 \%\) or more of the eighth-graders felt they were usually good at mathematics represented a range in mathematics performance - Australia, Canada, Colombia, Denmark, England, Greece, Iceland, Iran, Israel, Kuwait, New Zealand, Scotland, Sweden, and the United States.

Figure 4.2 indicates that, internationally, eighth-grade girls had lower self-perceptions than boys about how well they usually do in mathematics. This figure and the distributions shown in Table 4.11 also show that, on average, both boys and girls in the participating countries tended to agree (or sometimes disagree) about usually doing well in mathematics rather than report the extremes of strongly agreeing or disagreeing. For most countries both boys and girls tended to indicate that they did well in mathematics - a perception that did not always coincide with their achievement on the TIMSS mathematics test.

SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

Students were asked about the necessity of various attributes or activities to do well in mathematics (see Table 4.12). There was enormous variation from country to country in the percentage of eighth-grade students agreeing that natural talent or ability were important to do well in mathematics. Fewer than \(50 \%\) of the students agreed in England, France, Iceland, the Netherlands, and Sweden compared to \(90 \%\) or more in Colombia, Denmark, Hungary, and Iran. Internationally, relatively few students agreed that good luck was important to do well. The countries where more than \(50 \%\) of the eighth-graders agreed that good luck was needed to do well in mathematics included Colombia, the Czech Republic, Hungary, Iran, Japan, Korea, Kuwait, Latvia (LSS), Lithuania, Romania, the Russian Federation, and the Slovak Republic.

Internationally, there was a high degree of agreement among students that lots of hard work studying at home was necessary in order to do well in mathematics. Percentages of agreement were in the 80 s and 90 s for most countries, and in the 70 s for Austria, Germany, Hungary, Switzerland, and Thailand. The variation was substantial from country to country regarding students' agreement with the necessity of memorizing the textbook or notes. In Belgium (French), France, Iceland, Japan, Kuwait, and Thailand, \(90 \%\) or more of the eighth-grade students agreed or strongly agreed that memorization was important to doing well in mathematics. In contrast, fewer than \(40 \%\) so agreed in Austria, Latvia (LSS), Lithuania, Singapore, the Slovak Republic, Slovenia, Sweden, and Switzerland.

Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
A dash (-) indicates data are not available.

Students also were asked about why they need to do well in mathematics. Students could agree with any or all of the three areas of possible motivation presented in Table 4.13, including getting their desired job, to please their parents, and to get into their desired secondary school or university. There were substantial differences from country to country in students' responses. In Colombia, Cyprus, Iran, Kuwait, and Scotland, \(50 \%\) or more of the eighth-graders strongly agreed that they needed to do well in mathematics to get their desired job. The majority of students in nearly all countries either agreed or strongly agreed that getting their desired job was a motivating factor, except Korea, where \(53 \%\) of the students disagreed or strongly disagreed.

In Iran, Kuwait, and Thailand, \(50 \%\) or more of the students strongly agreed that they needed to do well in mathematics to please their parents. Even though in most countries the majority of the eighth-grade students agreed at some level that pleasing their parents was important, \(50 \%\) or more disagreed or strongly disagreed in Denmark, Iceland, Japan, the Netherlands, Slovenia, and Sweden. Internationally, the reason most frequently cited by students for needing to do well in mathematics was to get into students' desired secondary school or university. With the exception of Austria, Belgium (Flemish), Germany, the Netherlands, and Switzerland, three-fourths or more of the students strongly agreed or agreed that this was a motivating factor for doing well in mathematics.

\section*{What Are Students' Atitudes Towards Mathematics?}

To collect information on eighth-grade students' perceptions of mathematics, TIMSS asked them a series of questions about its utility, importance, and enjoyability. Students' perceptions about the value of learning mathematics may be considered as both an input and outcome variable, because their attitudes towards the subject can be related to educational achievement in ways that reinforce higher or lower performance. That is, students who do well in mathematics generally have more positive attitudes towards the subject, and those who have more positive attitudes tend to perform better.

Table 4.14 provides students' responses to the question about how much they like or dislike mathematics in relation to their average mathematics achievement. As anticipated, within nearly every country, a clear positive relationship can be observed between a stronger liking of mathematics and higher achievement. Even though the majority of eighth-graders in nearly every country indicated they liked mathematics to some degree, clearly not all students feel positive about this subject area. In Austria, the Czech Republic, Germany, Hungary, Japan, Korea, Lithuania, and the Netherlands, more than \(40 \%\) of the eighth-grade students reported disliking mathematics.

The data in Figure 4.3 reveal that, on average, eighth-graders of both genders were relatively neutral about liking mathematics. In no country did girls report a significantly stronger liking of the subject area than did boys. However, boys reported liking mathematics better than girls did in several countries, including Austria, France, Germany, Hong Kong, Japan, Norway, and Switzerland.

To gain some understanding about eighth-graders' view about the utility of mathematics and their enjoyment of it as a school subject, TIMSS asked students to state their level of agreement with the following four statements: 1) I would like a job that involved using mathematics, 2) Mathematics is important to everyone's life, 3) Mathematics is boring, and 4) I enjoy learning mathematics. The results for these four questions were averaged with students' responses to the question about liking mathematics to form an index of their overall attitudes towards mathematics based on all five questions.

The data for the index in Table 4.15 reveal that eighth-grade students generally had positive attitudes towards mathematics, and that those students with more positive attitudes had higher average mathematics achievement. On average, across the five questions comprising the mathematics attitude index, the majority of students in each TIMSS country expressed positive or strongly positive attitudes about mathematics. Very few students (usually only \(2 \%\) to \(3 \%\) ) consistently had strongly negative opinions about all aspects of the subject. Since these results seem slightly more supportive than students' liking of the subject alone, it may be that students understand the utility of mathematics to a greater extent than they actually like doing it.

Gender differences for the index of overall attitudes are portrayed in Figure 4.4. In many countries, girls and boys reported similar overall attitudes about mathematics. The countries where boys' attitudes were significantly more positive than those of girls included Austria, France, Germany, Greece, Hong Kong, Japan, the Netherlands, Norway, Sweden, and Switzerland. Interestingly, the index of overall attitudes towards mathematics showed gender differences in a somewhat different set of countries than the single question about liking mathematics. For the countries showing a gender difference on the attitudes index but not on the liking question, it is possible that boys more than girls perceive the relevance of mathematics.

Table 4.14
Students' Reports on How Much They Like Mathematics Upper Grade (Eighth Grade*)
\begin{tabular}{|c|c|c|c|c|c|c|c|c|}
\hline \multirow{2}{*}{Country} & \multicolumn{2}{|l|}{Dislike a Lot} & \multicolumn{2}{|r|}{Dislike} & \multicolumn{2}{|r|}{Like} & \multicolumn{2}{|r|}{Like a Lot} \\

\hline
\end{tabular}

Thdex of overall attitudes towards mathematics is based on average of responses to the following statements: 1) I would like a job that
involved using mathematics; 2) Mathematics is important to everyone's life; 3) Mathematics is boring (reversed scale); 4) I enjoy learning mathematics; 5) I like mathematics.
*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
sampling procedures (see Figure A.3). Background data for Bulgaria and South Arrica are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
A tilde ( ) indicates insufficient data to report achievement.

\section*{-Chapter 5}

\section*{Teachers and Instruction}

Teachers and the instructional approaches they use are fundamental in building students' mathematical understanding. Primary among their many duties and responsibilities, teachers structure and guide the pace of individual, small-group, and whole-class work to present new material, engage students in mathematical tasks, and help deepen students' grasp of the mathematics being studied. Teachers may help students use technology and tools to investigate mathematical ideas, analyze students' work for misconceptions, and promote positive attitudes about mathematics. They also may assign homework and conduct informal as well as formal assessments to monitor progress in student learning, make ongoing instructional decisions, and evaluate achievement outcomes.

Effective teaching is a complex endeavor requiring knowledge about the subject matter of mathematics, the ways students learn, and effective pedagogy in mathematics. It can be fostered through institutional support and adequate resources. Teachers also can support each other in planning instructional strategies, devising real-world applications of mathematical concepts, and developing sequences that move students from concrete tasks to the ability to think for themselves and explore mathematical theories.

TIMSS administered a background questionnaire to teachers to gather information about their backgrounds, training, and how they think about mathematics. The questionnaire also asked about how they spend their time related to their teaching tasks and the instructional approaches they use in their classrooms. Information was collected about the materials used in instruction, the activities students do in class, the use of calculators and computers in mathematics lessons, the role of homework, and the reliance on different types of assessment approaches.

This chapter presents the results of teachers' responses to some of these questions. Because the sampling for the teacher questionnaires was based on participating students, the responses to the mathematics teacher questionnaire do not necessarily represent all of the eighth-grade mathematics teachers in each of the TIMSS countries. Rather, they represent teachers of the representative samples of students assessed. It is important to note that in this report, the student is always the unit of analysis, even when information from the teachers' questionnaires is being reported. Using the student as the unit of analysis makes it possible to describe the instruction received by representative samples of students. Although this approach may provide a different perspective from that obtained by simply collecting information from teachers, it is consistent with the TIMSS goals of providing information about the educational contexts and performance of students.

Because countries were required to sample two classes (from adjacent grades), it was possible for an individual to be the mathematics or science teacher of both classes. In order to keep the response burden for teachers to a minimum, no teacher was asked to respond to more than one questionnaire, even where that teacher taught mathematics or science to more than one of the sampled classes. This, together with the fact that teachers sometimes did not complete the questionnaire assigned to them, meant that each country had some percentage of students for whom no teacher questionnaire information was available. The tables in this chapter contain special notation regarding the availability of teacher responses. For a country where teacher responses are available for \(70 \%\) to \(84 \%\) of the students, an " \(r\) " is included next to the data for that country. When teacher responses are available for \(50 \%\) to \(69 \%\) of the students, an " \(s\) " is included next to the data for that country. When teacher responses are available for less than \(50 \%\) of the students, an " \(x\) " replaces the data. \({ }^{1}\)

\section*{Who Delivers Mathematics Instruction?}

This section provides information about the mathematics teaching force in each of the participating countries, in terms of certification, degrees, age, gender, and years of teaching experience.

Table 5.1 summarizes information gathered from each country about the requirements for certification held by the majority of the seventh- and eighth-grade teachers. In many countries, the type of education required for qualification includes a university degree. In other countries, study at a teacher training institution is required, or even both a university degree and study at a teacher training institution. The number of years of post secondary education required for a teaching qualification ranged from two years in Iran to as much as six years in Canada, although many countries reported four years. All of the countries except Colombia, Cyprus, Greece, and Lithuania reported that teaching practice was required. A large number of countries reported that an evaluation or examination was required for certification. Those countries not having such a requirement included Canada, Colombia, Cyprus, Greece, Iran, Israel, Korea, Portugal, and the United States.

Table 5.2 contains teachers' reports on their age and gender. If a constant supply of teachers were entering the teaching force, devoting their careers to the classroom, and then retiring, one might expect approximately equivalent percentages of students taught by teachers in their \(20 \mathrm{~s}, 30 \mathrm{~s}, 40 \mathrm{~s}\), and 50 s . However, this does not appear to hold for most countries. In most countries, the majority of the eighth-grade students were taught by teachers in their 30s or 40s. Very few countries seemed to have a comparatively younger teaching force, but those that did included Hong Kong, Iran, Kuwait, and Portugal. In these four countries, \(40 \%\) or more of the students had mathematics teachers 29 years or younger and \(70 \%\) had teachers in their 30s or younger. According to teachers' reports, the teaching force in eighth-grade mathematics was comparatively older in a number of countries. The TIMSS participants

Similar to Chapter 4, background data are not available for Bulgaria and South Africa.
where \(70 \%\) or more of the eighth-grade students had mathematics teachers in their 40s or older included the Czech Republic, Denmark, France, Germany, Norway, Romania, the Slovak Republic, and Spain.

In about one-fourth of the countries, approximately equivalent percentages of eighthgrade students were taught mathematics by male teachers and female teachers. However, at least \(70 \%\) of the eighth-grade students had female mathematics teachers in the Czech Republic, Hungary, Israel, Latvia (LSS), Lithuania, the Russian Federation, the Slovak Republic, and Slovenia. In contrast, at least 70\% of the students had male teachers in Greece, Japan, the Netherlands, and Switzerland.

As might be expected from the differences in teachers' ages from country to country, the TIMSS data indicate differences in teachers' longevity across countries (see Table 5.3). Those countries with younger teaching forces tended to have more students taught by less experienced teachers. At least half the eighth-grade students had mathematics teachers with 10 years or less of experience in Hong Kong, Iran, Korea, Kuwait, Portugal, and Thailand. In contrast, at least half the students had mathematics teachers with more than 20 years of experience in Belgium (French), the Czech Republic, France, Romania, the Slovak Republic, and Spain.

The relationship between years of teaching experience and mathematics achievement was not consistent across countries. In about one-fourth of the countries, the eighthgrade students with the most experienced teachers (more than 20 years) had higher mathematics achievement than did those with less experienced teachers ( 5 years or fewer). This may reflect the practice of giving teachers with more seniority the more advanced classes. However, in several countries, this pattern of higher student performance for the more experienced teachers was reversed. For another one-fourth of the countries or so, there was essentially no difference in student performance in relation to years of teaching experience. For the remaining countries, there were inconsistent patterns of performance differences in relation to years of teaching experience.

\section*{Requirements for Certification Held by the Majority of Lower- and UpperGrade (Seventh and Eighth Grade*) Teachers \({ }^{1}\)}

\section*{What Are Teachers' Perceptions About Mathematics?}

Figure 5.1 depicts the percentages of eighth-grade students whose mathematics teachers reported certain beliefs about mathematics and the way mathematics should be taught. Teachers in many countries indicated a fairly practical view of mathematics, seeing it essentially as a way of modeling the real world. However, there was variation across countries in the amount of agreement with this view of the nature of mathematics. In Thailand and Iran, nearly all students had teachers who agreed or strongly agreed that mathematics is primarily a formal way of representing the real world, while in several of the Central or Eastern European countries (Slovenia, the Russian Federation, the Czech Republic, and Hungary), about \(40 \%\) or fewer of the students' mathematics teachers agreed with this view.

There also appeared to be nearly uniform agreement by teachers across countries about the inherent nature of mathematical abilities. In most countries, \(80 \%\) or more of the students had teachers who agreed that some students have a natural talent for mathematics.

Regarding perceptions about how to teach mathematics, teachers' opinions varied across countries concerning whether or not more practice during class is an effective approach to help students having difficulty. At least \(80 \%\) of the eighth-grade students in the Czech Republic, Cyprus, Greece, Iran, the Slovak Republic, Thailand, Kuwait, Portugal, and Romania had teachers who agreed or strongly agreed with this approach. Conversely, fewer than 20\% of the students in the Russian Federation and Norway had teachers who agreed with this approach.

There was nearly complete agreement by teachers across countries, however, that more than one representation should be used in teaching a mathematics topic. In only Hungary and Thailand did fewer than \(80 \%\) of the eighth-grade students have teachers that agreed with this approach. This instructional approach is particularly useful in helping students with different learning styles understand key ideas. Also, using data in different formats reinforces the idea of mathematics as a network of interconnected concepts and procedures.

TIMSS also queried teachers about the cognitive demands of mathematics, asking them to rate the importance of various skills for success in the discipline. Figure 5.2 shows the percentages of students whose teachers rated each of four different skills as very important. Across the participating countries, the fewest students had teachers who felt the ability to remember formulas and procedures was very important. There was a range, however, with teachers of approximately \(70 \%\) of the eighth-grade students in Kuwait and Ireland rating this ability as very important compared to those of fewer than 20\% of the students in Slovenia, Sweden, Korea, Austria, Portugal, Israel, Denmark, the Czech Republic, and Switzerland.

Internationally, most mathematics teachers felt it was very important for students to be able to think creatively, to understand how mathematics is used in the real world, and to be able to provide reasons to support their solutions. However, there was some variation across countries. Fewer than \(40 \%\) of the eighth-grade students in

Israel, Austria, Belgium (Flemish), Switzerland, Ireland, England, and France had teachers who felt it was very important to think creatively, and fewer than \(40 \%\) in Latvia (LSS), Korea, Thailand, Belgium (Flemish), Hong Kong, France, Israel, the Netherlands, Switzerland, and Ireland had teachers who felt it was very important to understand how mathematics is used in the real world. With the current calls from business and industry for helping students improve their ability to apply mathematics and solve practical problems in job-related situations, it might be rather surprising that teachers in these countries do not place more importance on these latter two aspects of mathematics. In all countries except the Czech Republic, Switzerland, the Netherlands, and Austria, the majority of students had teachers who felt it was very important to be able to provide reasons to support mathematical solutions.

\section*{How Do Mathematics Teachers Spend Their School-Related Time?}

The data in Table 5.4 reveal that in a number of countries, eighth-grade mathematics teachers are specialists. In Belgium (Flemish), Belgium (French), Cyprus, England, France, Kuwait, Lithuania, the Netherlands, New Zealand, Portugal, the Russian Federation, Scotland, and Slovenia, the majority of eighth-grade students had teachers who spent at least \(75 \%\) of their formally scheduled school time teaching mathematics.

For most participating countries, there was little difference in students' achievement according to whether they were taught by specialists. However, in some countries, such as Austria, England, France, Germany, Ireland, and Switzerland those students with specialists for teachers had higher average mathematics achievement. In Switzerland, this is at least partially because specialists teach the students in the higher tracks and generalists the students in lower tracks, and a similar situation may exist in the other countries displaying this relationship between achievement and degree of teaching specialization. Generally, it is important to keep in mind the complexity of the relationships between instruction and achievement. In tracked systems, many characteristics of instruction can be related to the track.

As shown in Table 5.5, teachers in most countries reported that mathematics classes typically meet for at least 2 hours per week, but less than 3.5 hours. However, from 3.5 up to nearly 5 hours of weekly class time was reported for \(50 \%\) or more of the eighth-grade students in Belgium (Flemish), Belgium (French), Canada, Colombia, the Czech Republic, France, Hong Kong, Kuwait, Latvia (LSS), New Zealand, the Russian Federation, Scotland, the Slovak Republic, Spain, Switzerland, and the United States. The data reveal no clear pattern between the number of in-class instructional hours and mathematics achievement either across or between countries. Common sense and research both support the idea that increased time on task can yield commensurate increases in achievement, yet this time also can be spent outside of school on homework or in special tutoring. The ability to use straightforward analyses such as these to disentangle complicated relationships also is made difficult by the practice of providing additional in-school instruction for lower-performing students.

In addition to their formally scheduled duties, teachers were asked about the number of hours per week spent on selected school-related activities outside the regular school day. Table 5.6 presents the results. For example, on average, eighth-grade students in Australia had mathematics teachers who spent 2.3 hours per week preparing or grading tests, and another 1.8 hours per week reading and grading papers. Their teachers spent 2.6 hours per week on lesson planning and 1.7 hours combined on meetings with students and parents. They spent 0.9 hours on professional reading and development and 3 hours on record keeping and administrative tasks combined. Across countries, teachers reported that grading tests, grading student work, and lesson planning were the most time consuming activities, averaging as much as 10 hours per week in Singapore. In general, teachers also reported several hours per week spent on keeping students' records and other administrative tasks.

Opportunities to meet with colleagues to plan curriculum or teaching approaches enable teachers to expand their views of mathematics, their resources for teaching, and their repertoire of teaching and learning skills. Table 5.7 contains teachers' reports on how often they meet with other teachers in their subject area to discuss and plan curriculum or teaching approaches. Teachers of the majority of the students reported weekly or even daily planning meetings in Belgium (French), Colombia, Cyprus, the Czech Republic, England, Hungary, Israel, Kuwait, Latvia (LSS), Lithuania, Norway, Scotland, the Slovak Republic, Slovenia, and Sweden. In the remaining countries, however, most students had mathematics teachers who reported only limited opportunities to plan curriculum or teaching approaches with other teachers (monthly or even yearly meetings).

\end{tabular}
*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
A dash (-) indicates data are not available. A tilde ( \(\sim\) ) indicates insufficient data to report achievement.
An "r" indicates teacher response data available for \(70-84 \%\) of students. An "s" indicates teacher response data available for 50-69\% of students.
An "x" indicates teacher response data available for \(<50 \%\) of students.

\section*{How Are Mathematics Classes Organized?}

Table 5.8 presents teachers' reports about the size of eighth-grade mathematics classes for the TIMSS countries. The data reveal rather large variations from country to country. According to teachers, mathematics classes were relatively small in a number of countries. For example, \(90 \%\) or more of the students were in mathematics classes of 30 or fewer students in Belgium (Flemish), Belgium (French), the Czech Republic, Denmark, France, Germany, Hungary, Iceland, Latvia (LSS), Lithuania, the Netherlands, Norway, Portugal, the Russian Federation, Scotland, Slovenia, Sweden, and Switzerland. At the other end of the spectrum, \(93 \%\) of the students in Korea and \(48 \%\) in Colombia were in mathematics classes with more than 40 students. In Hong Kong, Japan, and Singapore, \(90 \%\) of the students were in classes with more than 30 students. Extensive research about class size in relation to achievement indicates that the existence of such a relationship is dependent on the situation. Dramatic reductions in class size can be related to gains in achievement, but the chief effects of smaller classes often are in relation to teacher attitudes and instructional behaviors. The TIMSS data support the complexity of this issue. Across countries, the four highest-performing countries at the eighth grade - Singapore, Korea, Japan, and Hong Kong - are among those with the largest mathematics classes. Within countries, several show little or no relationship between achievement and class size, often because students are mostly all in classes of similar size. Within other countries, there appears to be a curvilinear relationship, or those students with higher achievement appear to be in larger classes. In some countries, larger classes may represent the more usual situation for mathematics teaching, with smaller classes used primarily for students needing remediation or for those students in the less-advanced tracks.

Teachers can adopt a variety of organizational and interactive approaches in mathematics class. Whole-class instruction can be very efficient, because it requires less time on management functions and provides more time for developing mathematics concepts. Teachers can make presentations, conduct discussions, or demonstrate procedures and applications to all students simultaneously. Both whole-class and independent work have been standard features of mathematics classrooms. Students also can benefit from the type of cooperative learning that occurs with effective use of small-group work. Because they can help each other, students in groups can often handle challenging situations beyond their individual capabilities. Further, the positive affective impact of working together mirrors the use of mathematics in the workplace.

SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

Figure 5.3 provides a pictorial view of the emphasis on individual, small-group, and whole-class work as reported by the mathematics teachers in the TIMSS countries. Because learning may be enhanced with teacher guidance and monitoring individual and small-group activities, the frequency of lessons using each of these organizational approaches is shown both with and without assistance of the teacher. Internationally, teachers reported that students working together as a class with the teacher teaching the whole class is a frequently used instructional approach. In most countries, approximately \(50 \%\) or even more of the eighth-grade students were taught this way during most or every lesson. In contrast, students working together as a class and responding to each other appeared to be a much less common approach, used for a third or fewer of the students on a frequent basis (except in Israel).

Equally as popular as having students working together as a class with the teacher teaching the whole class, was having students work individually with assistance from the teacher. Group work was reported to be the least frequent approach, but when such an approach was indicated, it was more often with than without the assistance of the teacher. In general, having students work without the assistance of the teacher, either individually or in groups, was not common in most countries, except Israel and possibly Latvia (LSS).

\section*{What Activities Do Students Do in Ther Mathematics Lessons?}

As shown in Table 5.9, mathematics teachers in the participating countries generally reported heavier reliance on curriculum guides than textbooks or examination specifications in deciding which topics to teach. Only Japan, Korea, the Netherlands, Sweden, and Thailand used textbooks more for this purpose than both other sources of information. In contrast, in almost all countries, the textbook was the major written source mathematics teachers used in deciding how to present a topic to their classes. Internationally, the textbook appears to play a role in mathematics classrooms in many countries. For nearly all students in all countries, teachers reported using a textbook in their mathematics classes (see Figure 5.4).

The types of activities teachers asked eighth-grade students to do, however, varied from country to country. Teachers were asked how often they asked students to practice computational skills, and the responses are shown in Table 5.10. It appears that in most countries, the majority of the students practice computation in most or every lesson.

The data in Table 5.11 reveal that the majority of students in most countries were asked to do some type of mathematics reasoning tasks in most or every lesson. The activities TIMSS asked about included explaining the reasoning behind an idea, using tables, charts, or graphs to represent and analyze relationships, working on problems for which there is no immediately obvious solution, and/or writing equations to represent relationships. In Cyprus, Romania, and the Russian Federation, \(55 \%\) or more of the students were asked to do at least one of these types of reasoning tasks in every lesson.

Teachers were not asked about the emphasis placed on using things from everyday life in solving mathematics problems, but students were (see Table 5.12). According to eighth-grade students, only a moderate emphasis is placed on doing these types of problems in mathematics class. Only in Canada, Cyprus, England, Greece, Iran, Latvia(LSS), New Zealand, Spain, and the United States did more than \(50 \%\) of the students report being asked to do such problems on a frequent basis (pretty often or almost always).

*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
\({ }^{1}\) Curriculum Guides include national, regional, and school curriculum guides; Textbooks include teacher and student editions, as well as other resource books; and Examination Specifications include national and regional levels.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent. A dash (-) indicates data are not available.
An "r" indicates teacher response data available for \(70-84 \%\) of students. An "s" indicates teacher response data available for \(50-69 \%\) of students.
An "x" indicates teacher response data available for \(<50 \%\) of students.
SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

\section*{Figure 5.4}

\section*{Teachers' Reports About Using a Textbook in Teaching Mathematics Upper Grade (Eighth Grade*)}

Countries are classified by percentage of students whose teachers reported that they use a textbook in teaching their mathematics class.

Note: Seventy percent of students in Colombia, and 49 percent in \({ }^{\text {s }}\) Belgium (French) had teachers who reported using a textbook in their mathematics class.

\footnotetext{

\section*{How Are Calculators and Computers Used?}

As shown in Table 5.13, nearly all eighth-grade students reported having a calculator in the home, except in Iran ( \(61 \%\) ), Romania ( \(62 \%\) ), and Thailand ( \(68 \%\) ). Internationally, fewer students reported a computer in the home, even though more than three-fourths did so in Denmark, England, Iceland, Ireland, Israel, the Netherlands, and Scotland. Between 50\% and 75\% so reported in Australia, Austria, Belgium (Flemish), Belgium (French), Canada, Germany, Kuwait, New Zealand, Norway, Sweden, Switzerland, and the United States. Fewer than \(20 \%\) of the eighth-grade students reported home computers in Colombia, Iran, Latvia (LSS), Romania, and Thailand.

Table 5.14 provides teachers' reports about how often calculators are used in eighthgrade mathematics classes. Even though calculators appear to be widely available in most countries, teachers reported considerable variation from country to country in the frequency of calculator use in mathematics classrooms. Although using calculators can take the drudgery out of mathematics and free the learner to concentrate on higher-order problem-solving skills, another point of view is that permitting unrestricted use of calculators may damage students' mastery of basic skills in mathematics.

According to teachers in many of the TIMSS countries, three-fourths or more of the eighth-grade students use calculators almost every day in their mathematics classes. The exceptions to at least weekly usage for the majority of the students were Belgium (Flemish), Greece, Iran, Ireland, Japan, Korea, Romania, and Thailand. As revealed in Table 5.15, teachers reported that students use calculators for a variety of purposes. Across countries, no single use appears to predominate, although checking answers, routine computation, and solving complex problems are frequent purposes in many countries. Using calculators on tests and exams was often less frequent than other uses, ranging from \(0 \%\) of the students in Japan and Thailand to \(64 \%\) in Austria.

Students' reports about the frequency of calculator usage in mathematics classes are presented in Table 5.16. Because different response categories were used for the student and teacher versions of the question, a direct comparison is difficult. It does appear that fewer students than teachers indicated nearly always using calculators. However, combining the two most frequent categories for students (pretty often and almost always) and comparing those percentages of responses to the two most frequent response categories for teachers (almost every day and once or twice a week) yields a fair degree of agreement between teachers' and students' reports.

Table 5.17 contains teachers' reports about how often computers are used in mathematics class to solve exercises or problems, and Table 5.18 contains students' responses to a similar question. Internationally, substantial percentages of teachers and students agreed that the computer is almost never used in most students' mathematics lessons. Teachers and students agree on moderate use of computers (more than \(20 \%\) of the students in some lessons) in Austria, Denmark, England, Sweden, and the United States.

Table 5.13

\footnotetext{
*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
}

Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
A dash (-) indicates data are not available. A tilde ( \(\sim\) ) indicates insufficient data to report achievement.

\hline
\end{tabular}
*Eighth grade in most countries; see Table 2 for more information about the grades tested in each country.
Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
sampling procedures (see Figure A.3). Background data for Bulgaria and South Africa are unavailable.
Because population coverage falls below \(65 \%\), Latvia is annotated LSS for Latvian Speaking Schools only.
( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
A tilde ( \(\sim\) ) indicates insufficient data to report achievement.

\section*{How Much Homework Are Students Assigned?}

Although teachers often give students time to begin or review homework assignments in class, homework is generally considered a method of extending the time spent on regular classroom lessons. Table 5.19 presents teachers' reports about how often they assigned homework and the typical lengths of such assignments. Internationally, most eighth-grade students are assigned homework at least three times a week. Most typically, for the majority of students the assignments were 30 minutes or less in length. Homework assignments were more than 30 minutes for the majority of students in Cyprus, Greece, Romania, the Russian Federation, Singapore, and Thailand. The majority of students were assigned mathematics homework less frequently than three times a week in Belgium (Flemish), the Czech Republic, England, Iran, Japan, Korea, Scotland, and Sweden, although teachers in England and Iran gave longer assignments for about half of their students.

Homework generally has its biggest impact when it is commented on and graded by teachers. Table 5.20 presents teachers' reports about their use of students' written mathematics homework. In most countries, for at least \(70 \%\) of the students, teachers reported at least sometimes, if not always, correcting homework assignments and returning those assignments to students. The exceptions were France, Germany, Hungary, Iceland, Japan, the Netherlands, Portugal, the Slovak Republic, and Slovenia.

Many teachers do not count mathematics homework directly in determining grades, but use it more as a method to monitor students' understanding and to correct misconceptions. In general, for the TIMSS countries, teachers reported that mathematics homework assignments contributed only sometimes to students' grades or marks. In some countries, however, it had even less impact on grades. According to their teachers, homework never or only rarely contributed to the grades for the majority of the students in Austria, Belgium (Flemish), the Czech Republic, Denmark, France, Germany, Hungary, Ireland, Japan, Korea, Latvia (LSS), Lithuania, the Netherlands, Norway, Singapore, the Slovak Republic, Slovenia, Sweden, and Switzerland. At the other end of the continuum, teachers reported that homework always contributed to the grades for the majority of the students in Cyprus, England, Portugal, the Russian Federation, and the United States.

\section*{What Assessment and Evaluation Procedures Do Teachers Use?}

Teachers in participating countries were asked about the importance they place on different types of assessment and how they use assessment information. Their responses to these two questions are presented in Tables 5.21 and 5.22 , respectively. The weight given to each type of assessment varied greatly from country to country. Internationally, the least weight reportedly was given to external standardized tests and teacher-made objective tests. Across all participating countries, fewer than \(80 \%\) of the eighth-grade students had mathematics teachers who reported giving quite a lot or a great deal of weight to these types of assessments.

The Hungarian teachers reported the heaviest emphasis on projects or practical exercises. They reported relying on this type of assessment for \(90 \%\) of the students, with the next highest countries being Colombia with \(77 \%\), Denmark with \(74 \%\), and Israel with \(70 \%\). However, the most heavily weighted types of assessment were teacher-made tests requiring explanations, observations of students, and students' responses in class. One or more of these assessment types was weighted heavily for \(80 \%\) or more of the eighth-grade students in many European and Eastern European countries. In contrast, teachers were in less agreement about assessment approaches within Australia, Canada, England, Hong Kong, Israel, Japan, Korea, New Zealand, Singapore, Slovenia, Switzerland, Thailand, and the United States, where no type of assessment was weighted heavily for as many as \(80 \%\) of the students.

As might be anticipated, mathematics teachers in most countries reported using assessment information to provide grades or marks, to provide student feedback, to diagnose learning problems, and to plan future lessons. Teachers in fewer countries reported considerable use of assessment information to report to parents or for the purpose of tracking or making program assignments.

As reported in Table 5.23, eighth-grade students reported substantial variation in the frequency of testing in mathematics classes. The majority of the students reported having quizzes and tests only once in a while or never in Austria, the Czech Republic, Denmark, England, Germany, Hungary, Iceland, Ireland, Japan, Korea, Latvia (LSS), Norway, Scotland, and the Slovak Republic. In contrast, one-third or more of the students reported almost always having quizzes or tests in Colombia, Hong Kong, Kuwait, Romania, Spain, and the United States. In a number of countries, there was a tendency for the reports of the most frequent testing to be associated with lowerachieving students. One could argue that these students can least afford time diverted from their ongoing instructional program. However, teachers may provide shorter lessons and follow-up quizzes for lower-achieving students to more closely monitor their grasp of the subject matter.

\section*{- Appendix A}

> Overvew of TIMSS Procedures: Mathematics Achievement Results for Seventhand Eighth-Grade Students

\section*{History}

TIMSS represents the continuation of a long series of studies conducted by the International Association for the Evaluation of Educational Achievement (IEA). Since its inception in 1959, the IEA has conducted more than 15 studies of crossnational achievement in curricular areas such as mathematics, science, language, civics, and reading. IEA conducted its First International Mathematics Study (FIMS) in 1964, and the Second International Mathematics Study (SIMS) in 1980-82. The First and Second International Science Studies (FISS and SISS) were conducted in 1970-71 and 1983-84, respectively. Since the subjects of mathematics and science are related in many respects, the third studies were conducted together as an integrated effort. \({ }^{1}\)

The number of participating countries and testing both mathematics and science resulted in TIMSS becoming the largest, most complex IEA study to date and the largest international study of educational achievement ever undertaken. Traditionally, IEA studies have systematically worked toward gaining more in-depth understanding of how various factors contribute to the overall outcomes of schooling. Particular emphasis has been given to refining our understanding of students' opportunity to learn as this opportunity becomes successively defined and implemented by curricular and instructional practices. In an effort to extend what had been learned from previous studies and provide contextual and explanatory information, the magnitude of TIMSS expanded beyond the already substantial task of measuring achievement in two subject areas to also include a thorough investigation of curriculum and how it is delivered in classrooms around the world.

\section*{The Components of TIMSS}

Continuing the approach of previous IEA studies, TIMSS addressed three conceptual levels of curriculum. The intended curriculum is composed of the mathematics and science instructional and learning goals as defined at the system level. The implemented curriculum is the mathematics and science curriculum as interpreted by teachers and made available to students. The attained curriculum is the mathematics and science content that students have learned and their attitudes

\footnotetext{
Because a substantial amount of time has elapsed since earlier IEA studies in mathematics and science, curriculum and testing methods in these two subjects have undergone many changes. Because TIMSS has devoted considerable energy toward reflecting the most current educational and measurement practices, changes in items and methods as well as differences in the populations tested make comparisons of TIMSS results with those of previous studies very difficult. The focus of TIMSS is not on measuring achievement trends, but rather on providing up-to-date information about the current quality of education in mathematics and science.
}
towards these subjects. To aid in meaningful interpretation and comparison of results, TIMSS also collected extensive information about the social and cultural contexts for learning, many of which are related to variation among different educational systems.

Even though slightly fewer countries completed all the steps necessary to have their data included in this report, nearly 50 countries participated in one or more of the various components of the TIMSS data collection effort, including the curriculum analysis. To gather information about the intended curriculum, mathematics and science specialists within each participating country worked section-by-section through curriculum guides, textbooks, and other curricular materials to categorize aspects of these materials in accordance with detailed specifications derived from the TIMSS mathematics and science curriculum frameworks. \({ }^{2}\) Initial results from this component of TIMSS can be found in two companion volumes: Many Visions, Many Aims: A Cross-National Investigation of Curricular Intention in School Mathematics and Many Visions, Many Aims: A Cross-National Investigation of Curricular Intentions in School Science. \({ }^{3}\)

To measure the attained curriculum, TIMSS tested more than half a million students in mathematics and science at five grade levels. TIMSS included testing at three separate populations:

Population 1. Students enrolled in the two adjacent grades that contained the largest proportion of 9-year-old students at the time of testing - third- and fourthgrade students in most countries.

Population 2. Students enrolled in the two adjacent grades that contained the largest proportion of 13-year-old students at the time of testing - seventh- and eighth-grade students in most countries.

Population 3. Students in their final year of secondary education. As an additional option, countries could test two special subgroups of these students:
1) Students taking advanced courses in mathematics, and
2) Students taking physics.

Countries participating in the study were required to administer tests to the students in the two grades at Population 2, but could choose whether or not to participate at the other levels. In about half of the countries at Populations 1 and 2, subsets of the upper-grade students who completed the written tests also participated in a performance assessment. In the performance assessment, students engaged in a number of hands-on

}
mathematics and science activities. The students designed experiments, tested hypotheses, and recorded their findings. For example, in one task, students were asked to investigate probability by repeatedly rolling a die, applying a computational algorithm, and proposing explanations in terms of probability for patterns that emerged. Figure A. 1 shows the countries that participated in the various components of TIMSS achievement testing.

TIMSS also administered a broad array of questionnaires to collect data about how the curriculum is implemented in classrooms, including the instructional practices used to deliver it. The questionnaires also were used to collect information about the social and cultural contexts for learning. Questionnaires were administered at the country level about decision-making and organizational features within their educational systems. The students who were tested answered questions pertaining to their attitudes towards mathematics and science, classroom activities, home background, and out-of-school activities. The mathematics and science teachers of sampled students responded to questions about teaching emphasis on the topics in the curriculum frameworks, instructional practices, textbook usage, professional training and education, and their views on mathematics and science. The heads of schools responded to questions about school staffing and resources, mathematics and science course offerings, and teacher support. In addition, a volume was compiled that presents descriptions of the educational systems of the participating countries. \({ }^{4}\)

With its enormous array of data, TIMSS has numerous possibilities for policy-related research, focused studies related to students' understandings of mathematics and science subtopics and processes, and integrated analyses linking the various components of TIMSS. The initial round of reports is only the beginning of a number of research efforts and publications aimed at increasing our understanding of how mathematics and science education functions across countries, investigating what impacts student performance, and helping to improve mathematics and science education.

\section*{Developing the TIMSS Mathematics Test}

The TIMSS curriculum framework underlying the mathematics tests at all three populations was developed by groups of mathematics educators with input from the TIMSS National Research Coordinators (NRCs). As shown in Figure A.2, the mathematics curriculum framework contains three dimensions or aspects. The content aspect represents the subject matter content of school mathematics. The performance expectations aspect describes, in a non-hierarchical way, the many kinds of performances or behaviors that might be expected of students in school mathematics. The perspectives aspect focuses on the development of students' attitudes, interest, and motivations in mathematics. \({ }^{5}\)

Working within the mathematics curriculum framework, mathematics test specifications were developed for Population 2 that included items representing a wide range of mathematics topics and eliciting a range of skills from the students. The tests were developed through an international consensus involving input from experts in mathematics and measurement specialists. The TIMSS Subject Matter Advisory Committee, including distinguished scholars from 10 countries, ensured that the test reflected current thinking and priorities within the field of mathematics. The items underwent an iterative development and review process, with one of the pilot testing efforts involving 43 countries. Every effort was made to help ensure that the tests represented the curricula of the participating countries and that the items did not exhibit any bias towards or against particular countries, including modifying specifications in accordance with data from the curriculum analysis component, obtaining ratings of the items by subject matter specialists within the participating countries, and conducting thorough statistical item analysis of data collected in the pilot testing. The final forms of the test were endorsed by the NRCs of the participating countries. \({ }^{6}\) In addition, countries had an opportunity to match the content of the test to their curricula at the seventh and eighth grades. They identified items measuring topics not covered in their intended curriculum. The information from this Test-Curriculum Matching Analysis indicates that omitting such items has little effect on the overall pattern of results (see Appendix B).

Table A. 1 presents the six content areas included in the Population 2 mathematics test and the numbers of items and score points in each category. Distributions also are included for the four performance categories derived from the performance expectations aspect of the curriculum framework. Approximately one-fourth of the items were in the free-response format, requiring students to generate and write their own answers. Designed to represent approximately one-third of students' response

\footnotetext{
In scoring the tests correct answers to most items were worth one point. However, responses to some constructed-response items were evaluated for partial credit with a fully correct answer awarded up to three points. In addition, some items had two parts. Thus, the number of score points exceeds the number of items in the test.
\({ }^{2}\) One item in the Measurement category was deleted prior to analysis due to poor performing item statistics.
\({ }^{3}\) Includes two extended-response items classified as "Justifying and Proving" and two extended-response items classified as "Communicating."
}

SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.
time, some free-response questions asked for short answers while others required extended responses where students needed to show their work. The remaining questions used a multiple-choice format. In scoring the tests, correct answers to most questions were worth one point. Consistent with the approach of allotting students longer response time for the constructed-response questions than for multiple-choice questions, however, responses to some of these questions (particularly those requiring extended responses) were evaluated for partial credit with a fully correct answer being awarded two or even three points (see later section on scoring). This, in addition to the fact that several items had two parts, means that the total number of score points available for analysis somewhat exceeds the number of items included in the test.

The TIMSS instruments were prepared in English and translated into 30 additional languages. In addition, it sometimes was necessary to adapt the international versions for cultural purposes, including the 11 countries that tested in English. This process represented an enormous effort for the national centers, with many checks along the way. The translation effort included: 1) developing explicit guidelines for translation and cultural adaptation, 2) translation of the instruments by the national centers in accordance with the guidelines and using two or more independent translations, 3) consultation with subject-matter experts regarding cultural adaptations to ensure that the meaning and difficulty of items did not change, 4) verification of the quality of the translations by professional translators from an independent translation company, 5) corrections by the national centers in accordance with the suggestions made, 6) verification that corrections were implemented, and 7) a series of statistical checks after the testing to detect items that did not perform comparably across countries. \({ }^{7}\)

\footnotetext{
\({ }^{7}\) More details about the translation verification procedures can be found in Mullis, I.V.S., Kelly, D.L., and Haley, K. (1996). "Translation Verification Procedures" in M.O. Martin and I.V.S. Mullis (eds.), Third International Mathematics and Science Study: Quality Assurance in Data Collection. Chestnut Hill, MA: Boston College; and Maxwell, B. (1996). "Translation and Cultural Adaptation of the TIMSS Instruments" in M.O. Martin and D.L. Kelly (eds.), Third International Mathematics and Science Study Technical Report, Volume I. Chestnut Hill, MA: Boston College
}

\section*{TIMSS Test Design}

Not all of the students in Population 2 responded to all of the mathematics items. To ensure broad subject matter coverage without overburdening individual students, TIMSS used a rotated design that included both the mathematics and science items. Thus, the same students participated in both the mathematics and science testing. The TIMSS Population 2 test consisted of eight booklets, with each booklet requiring 90 minutes of student response time. In accordance with the design, the mathematics and science items were assembled into 26 different clusters (labeled A through Z). Eight of the clusters were designed to take students 12 minutes to complete; 10 of the clusters, 22 minutes; and 8 clusters, 10 minutes. In all, the design provided a total of 396 unique testing minutes, 198 for mathematics and 198 for science. Cluster A was a core cluster assigned to all booklets. The remaining clusters were assigned to the booklets in accordance with the rotated design so that representative samples of students responded to each cluster. \({ }^{8}\)

\section*{Sample Implementation and Participation Rates}

The selection of valid and efficient samples is crucial to the quality and success of an international comparative study such as TIMSS. The accuracy of the survey results depends on the quality of sampling information available and on the quality of the sampling activities themselves. For TIMSS, NRCs worked on all phases of sampling with staff from Statistics Canada. NRCs received training in how to select the school and student samples and in the use of the sampling software. In consultation with the TIMSS sampling referee (Keith Rust, WESTAT, Inc.), staff from Statistics Canada reviewed the national sampling plans, sampling data, sampling frames, and sample execution. This documentation was used by the International Study Center in consultation with Statistics Canada, the sampling referee, and the Technical Advisory Committee, to evaluate the quality of the samples.

In a few situations where it was not possible to implement TIMSS testing for the entire internationally desired definition of Population 2 (all students in the two adjacent grades with the greatest proportion of 13 -year-olds), countries were permitted to define a national desired population which did not include part of the internationally desired population. Table A. 2 shows any differences in coverage between the international and national desired populations. Most participants achieved \(100 \%\) coverage ( 36 out of 42). The countries with less than \(100 \%\) coverage are annotated in tables in this report. In some instances, countries, as a matter of practicality, needed to define their tested population according to the structure of school systems, but in Germany and Switzerland, parts of the country were simply unwilling to take part in TIMSS. Because coverage fell below 65\% for Latvia, the Latvian results have been labeled "Latvia (LSS)," for Latvian Speaking Schools, throughout the report.

\footnotetext{
8 The design is fully documented in Adams, R. and Gonzalez, E. (1996). "Design of the TIMSS Achievement Instruments" in D.F. Robitaille and R.A. Garden (eds.), TIMSS Monograph No. 2: Research Questions and Study Design. Vancouver, B.C.: Pacific Education Press; and Adams, R. and Gonzalez, E. (1996). "TIMSS Test Design" in M.O. Martin and D.L. Kelly (eds.), Third International Mathematics and Science Study Technical Report, Volume I. Chestnut Hill, MA: Boston College.

\hline Thailand & 100\% & & 6.2\% & 0.0\% & 6.2\% \\
\hline United States & 100\% & & 0.4\% & 1.7\% & 2.1\% \\
\hline
\end{tabular}

\footnotetext{
\({ }^{1}\) National Desired Population does not cover all of International Desired Population. Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
\({ }^{2}\) National Defined Population covers less than 90 percent of National Desired Population.
* One region (Baden-Wuerttemberg) did not participate.

SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.
}

Within the desired population, countries could define a population that excluded a small percent (less than 10\%) of certain kinds of schools or students that would be very difficult or resource intensive to test (e. g., schools for students with special needs or schools that were very small or located in extremely remote areas). Table A. 2 also shows that the degree of such exclusions was small. Only England exceeded the \(10 \%\) limit, and this is annotated in the tables in this report.

Countries were required to test the two adjacent grades with the greatest proportion of 13-year-olds. Table A. 3 presents, for each country, the percentage of 13-year-olds in the lower grade tested, the percentage in the upper grade, and the percentage in both the upper and lower grades combined.

Within countries, TIMSS used a two-stage sample design at Population 2, where the first stage involved selecting 150 public and private schools within each country. Within each school, the basic approach required countries to use random procedures to select one mathematics class at the eighth grade and one at the seventh grade (or the corresponding upper and lower grades in that country). All of the students in those two classes were to participate in the TIMSS testing. This approach was designed to yield a representative sample of 7,500 students per country, with approximately 3,750 students at each grade. \({ }^{9}\) Typically, between 450 and 3,750 students responded to each item at each grade level, depending on the booklets in which the items were located.

Countries were required to obtain a participation rate of at least \(85 \%\) of both schools and students, or a combined rate (the product of school and student participation) of \(75 \%\). Tables A. 4 through A. 8 present the participation rates and achieved sample sizes for the eighth and seventh grades.

\footnotetext{
\({ }^{9}\) The sample design for TIMSS is described in detail in Foy, P., Rust, K. and, Schleicher, A., (1996). "TIMSS Sample Design" in M.O. Martin and D.L. Kelly (eds.), Third International Mathematics and Science Study Technical Report, Volume I. Chestnut Hill, MA: Boston College.

\section*{Indicating Complance with Sampling Guidelines in the Report}

Figure A. 3 shows how countries have been grouped in tables reporting achievement results. Countries that achieved acceptable participation rates \(-85 \%\) of both the schools and students, or a combined rate (the product of school and student participation) of \(75 \%\) - with or without replacement schools, and that complied with the TIMSS guidelines for grade selection and classroom sampling are shown in the first panel of Figure A.3. Countries that met the guidelines only after including replacement schools are annotated. These countries ( 25 at the eighth grade and 27 at the seventh grade) appear in the tables in Chapters 1, 2, and 3 ordered by achievement.

Countries not reaching at least \(50 \%\) school participation without the use of replacements schools, or that failed to reach the sampling participation standard even with the inclusion of replacement schools, are shown in the second panel of Figure A.3. These countries are presented in a separate section of the achievement tables in Chapters 1,2 , and 3 in alphabetical order, and are shown in tables in Chapters 4 and 5 in italics.

To provide a better curricular match, four countries (i.e., Colombia, Germany, Romania, and Slovenia) elected to test their seventh- and eighth-grade students even though that meant not testing the two grades with the most 13 -year-olds and led to their students being somewhat older than those in the other countries. These countries are also presented in a separate section of the achievement tables in Chapters 1, 2, and 3 in alphabetical order, and are shown in tables in Chapter 4 and 5 in italics. Table A. 3 shows the percentage of 13-year-olds for each country in the grades tested.

For a variety of reasons, three countries (Denmark, Greece, and Thailand) did not comply with the guidelines for sampling classrooms. Their results are also presented in a separate section of the achievement tables in Chapters 1, 2, and 3 in alphabetical order, and are italicized in tables in Chapter 4 and 5. At the eighth grade, Israel, Kuwait, and South Africa also had difficulty complying with the classroom selection guidelines, but in addition had other difficulties (Kuwait tested a single grade with relatively few 13 -year-olds; Israel and South Africa had low sampling participation rates), and so these countries are also presented in separate sections in tables in Chapters 1, 2, and 3, and are italicized in tables in Chapter 4 and 5. At the seventh grade, South Africa had a better sampling participation rate, and is presented in the same section of tables as Denmark, Greece, and Thailand. Israel and Kuwait did not test at the seventh grade.

Because the Philippines was not able to document clearly the school sampling procedures used, its results are not presented in the main body of the report. A small set of results for the Philippines can be found in Appendix C.

}

\section*{Data Collection}

Each participating country was responsible for carrying out all aspects of the data collection, using standardized procedures developed for the study. Training manuals were developed for school coordinators and test administrators that explained procedures for receipt and distribution of materials as well as for the activities related to the testing sessions. The test administrator manuals covered procedures for test security, standardized scripts to regulate directions and timing, rules for answering students' questions, and steps to ensure that identification on the test booklets and questionnaires corresponded to the information on the forms used to track students.

Each country was responsible for conducting quality control procedures and describing this effort as part of the NRC's report documenting procedures used in the study. In addition, the International Study Center considered it essential to establish some method to monitor compliance with standardized procedures. NRCs were asked to nominate a person, such as a retired school teacher, to serve as quality control monitor for their countries, and in almost all cases, the International Study Center adopted the NRCs' first suggestion. The International Study Center developed manuals for the quality control monitors and briefed them in two-day training sessions about TIMSS, the responsibilities of the national centers in conducting the study, and their own roles and responsibilities.

The quality control monitors interviewed the NRCs about data collection plans and procedures. They also selected a sample of approximately 10 schools to visit, where they observed testing sessions and interviewed school coordinators. \({ }^{10}\) Quality control monitors observed test administrations and interviewed school coordinators in 37 countries, and interviewed school coordinators or test administrators in 3 additional countries.

The results of the interviews indicate that, in general, NRCs had prepared well for data collection and, despite the heavy demands of the schedule and shortages of resources, were in a position to conduct the data collection in an efficient and professional manner. Similarly, the TIMSS tests appeared to have been administered in compliance with international procedures, including the activities preliminary to the testing session, the activities during the testing sessions, and the school-level activities related to receiving, distributing, and returning materials from the national centers.

\footnotetext{
\({ }^{10}\) The results of the interviews and observations by the quality control monitors are presented in Martin, M.O., Hoyle, C.D., and Gregory, K.D. (1996). \section*{Scoring the Free-Response Items}

Because approximately one-third of the written test time was devoted to free-response items, TIMSS needed to develop procedures for reliably evaluating student responses within and across countries. Scoring utilized two-digit codes with rubrics specific to each item. Development of the rubrics was led by the Norwegian TIMSS national center. The first digit designates the correctness level of the response. The second digit, combined with the first digit, represents a diagnostic code used to identify specific types of approaches, strategies, or common errors and misconceptions. Although not specifically used in this report, analyses of responses based on the second digit should provide insight into ways to help students better understand mathematics concepts and problem-solving approaches.

To meet the goal of implementing reliable scoring procedures based on the TIMSS rubrics, the International Study Center prepared guides containing the rubrics and explanations of how to implement them together with example student responses for the various rubric categories. These guides, together with more examples of student responses for practice in applying the rubrics were used as a basis for an ambitious series of regional training sessions. The training sessions were designed to assist representatives of national centers who would then be responsible for training personnel in their respective countries to apply the two-digit codes reliably. \({ }^{11}\)

To gather and document empirical information about the within-country agreement among scorers, TIMSS developed a procedure whereby systematic subsamples of approximately \(10 \%\) of the students' responses were to be coded independently by two different readers. To provide information about the cross-country agreement among scorers, TIMSS conducted a special study at Population 2, where 39 scorers from 21 of the participating countries evaluated common sets of students' responses to more than half of the free-response items.

Table A. 9 shows the average and range of the within-country exact percent of agreement between scorers on the free-response items in the Population 2 mathematics test for 26 countries. Unfortunately, lack of resources precluded several countries from providing this information. A very high percent of exact agreement was observed, with averages across the items for the correctness score ranging from \(97 \%\) to \(100 \%\) and an overall average of \(99 \%\) across the 26 countries.

The cross-country coding reliability study involved 350 students' responses for each of 14 mathematics and 17 science items, totaling 10,850 responses in all. The responses were random samples from the within-country reliability samples from seven English-test countries: Australia, Canada, England, Ireland, New Zealand, Singapore, and the United States. The responses were presented to the scorers according to a

\footnotetext{

rotated design whereby each response was coded by 7 to 18 different scorers. This design resulted in a large number of comparisons between coders, approximately 10,000 or more for each item.

Table A. 10 presents the percent of exact agreement for the 14 mathematics items and the scorers involved in the international study. For comparison purposes, it also shows the average and range of the percent of exact agreement for each of the items within the 26 countries submitting data about their scoring reliability. The percent of exact agreement for each mathematics item was very high, with only two items having measures below \(90 \%\) on the correctness score agreement. Also, for the correctness score agreement, all items were well within the range of the within-country results. The TIMSS data from the reliability studies indicate that scoring procedures were extremely robust for the mathematics items, especially for the correctness score used for the analyses in this report. \({ }^{12}\)

\section*{Test Reliability}

Table A. 11 displays the test reliability coefficient for each country for the lower and upper grades (usually seventh and eighth grades). This coefficient is the median KR-20 reliability across the eight test booklets. Median reliabilities in the lower grade ranged from 0.91 in Hong Kong and Korea to 0.75 in Iran, and in the upper grade from 0.91 in Bulgaria to 0.73 in Kuwait. The international median, shown in the last row of the table is the median of the reliability coefficients for all countries. These international medians are 0.86 for the lower grade and 0.89 for the upper grade.

\section*{Data Processing}

To ensure the availability of comparable, high quality data for analysis, TIMSS engaged in a rigorous set of quality control steps to create the international database. \({ }^{13}\) TIMSS prepared manuals and software for countries to use in entering their data so the information would be in a standardized international format before being forwarded to the IEA Data Processing Center in Hamburg for creation of the international database. Upon arrival at the IEA Data Processing Center, the data from each country underwent an exhaustive cleaning process. The data cleaning process involved several iterative steps and procedures designed to identify, document, and correct deviations from the international instruments, file structures, and coding schemes. This process also emphasized consistency of information within national data sets and appropriate linking among the many student, teacher, and school data files.

Throughout the process, the data were checked and double-checked by the IEA Data Processing Center, the International Study Center, and the national centers. The national centers were contacted regularly and given multiple opportunities to review the data for their countries. In conjunction with the Australian Council for Educational Research (ACER), the International Study Center conducted a review of item statistics for each of the cognitive items in each of the countries to identify poorly performing items. Twenty-one countries had one or more items deleted (in most cases, one). Usually the poor statistics (negative point-biserials for the key, large item-by-country interactions, and statistics indicating lack of fit with the model) were a result of translation, adaptation, or printing deviations.

\footnotetext{
\({ }^{13}\) These steps are detailed in Jungclaus, H. and Bruneforth, M. (1996). "Data Consistency Checking Across Countries" in M.O. Martin and D.L. Kelly (eds.), Third International Mathematics and Science Study Technical Report, Volume I. Chestnut Hill, MA: Boston College.

\section*{IRT Scaling and Data Analysis}

Two general analysis approaches were used for this report - item response theory scaling methods and average percent correct technology. The overall mathematics results were summarized using an item response theory (IRT) scaling method (Rasch model). This scaling method produces a mathematics score by averaging the responses of each student to the items which they took in a way that takes into account the difficulty of each item. The methodology used in TIMSS includes refinements that enable reliable scores to be produced even though individual students responded to relatively small subsets of the total mathematics item pool. Analyses of the response patterns of students from participating countries indicated that, although the items in the test address a wide range of mathematical content, the performance of the students across the items was sufficiently consistent to be usefully summarized in a single mathematics score.

The IRT methodology was preferred for developing comparable estimates of performance for all students, since students answered different test items depending upon which of the eight test booklets they received. The IRT analysis provides a common scale on which performance can be compared across countries. In addition to providing a basis for estimating mean achievement, scale scores permit estimates of how students within countries vary and provide information on percentiles of performance. The scale was standardized using students from both the grades tested. When all participating countries and grades are treated equally, the TIMSS scale average is 500 and the standard deviation is 100 . Since the countries varied in size, each country was reweighted to contribute equally to the mean and standard deviation of the scale. The average of the scale scores was constructed to be the average of the 41 means of participants that were available at the eighth grade and the 39 means at the seventh grade. The average and standard deviation of the scale scores are arbitrary and do not affect scale interpretations.

The analytic approach underlying the results in Chapters 2 and 3 of this report involved calculating the percentage of correct answers for each item for each participating country (as well as the percentages of different types of incorrect responses). The percents correct were averaged to summarize mathematics performance overall and in each of the content areas for each country as a whole and by gender. For items with more than one part, each part was analyzed separately in calculating the average percents correct. Also, for items with more than one point awarded for full credit, the average percents correct reflect an average of the points received by students in each country. This was achieved by including the percent of students receiving one score point as well as the percentage receiving two score points and three score points in the calculations. Thus, the average percents correct are based on the number of score points rather than the number of items, per se. An exception to this is the international average percents correct reported for example items, where the values reflect the percent of students receiving full credit.

\section*{Estimating Sampling Error}

Because the statistics presented in this report are estimates of national performance based on samples of students, rather than the values that could be calculated if every student in every country would have answered every question, it is important to have measures of the degree of uncertainty of the estimates. The jackknife procedure was used to estimate the standard error associated with each statistic presented in this report. The use of confidence intervals, based on the standard errors, provides a way to make inferences about the population means and proportions in a manner that reflects the uncertainty associated with the sample estimates. An estimated sample statistic plus or minus two standard errors represents a \(95 \%\) confidence interval for the corresponding population result.

\section*{-Appendix B}

The Test-Curriculum Matching Analysis

When comparing student achievement across countries, it is important that the comparisons be as "fair" as possible. TIMSS has worked towards this goal in a number of ways, including providing detailed procedures for standardizing the population definitions, sampling, test translations, test administration, scoring, and database formation. Developing the TIMSS tests involved the interaction of experts in the field of mathematics with representatives of the participating countries and testing specialists. \({ }^{1}\) The National Research Coordinators (NRCs) from each country formally approved the TIMSS test, thus accepting it as being sufficiently fair to compare their students' mathematics achievement with that of students from other countries.

Although the TIMSS test was developed to represent a set of agreed-upon mathematics content areas, there are differences among the curricula of participating countries that result in various mathematics topics being taught at different grades. To restrict test items not only to those topics in the curricula of all countries but also to those covered in the same sequence in all participating countries would severely limit test coverage and restrict the research questions about international differences that TIMSS is designed to address. The TIMSS tests, therefore, inevitably contain some items measuring topics unfamiliar to some students in some countries.

The Test-Curriculum Matching Analysis (TCMA) was developed and conducted to investigate the appropriateness of the TIMSS mathematics test for seventh- and eighth-grade students in the participating countries, and to show how student performance for individual countries varied when based only on the test questions that were judged to be relevant to their own curriculum. \({ }^{2}\)

To gather data about the extent to which the TIMSS tests were relevant to the curriculum of the participating countries, TIMSS asked the NRC of each country to report whether or not each item was in the country's intended curriculum at each of the two grades being tested. The NRC was asked to choose a person or persons who were very familiar with the curricula at the grades being tested to make the determination. Since an item might be in the curriculum for some but not all students in a country, an item was determined appropriate if it was in the intended curriculum for more than \(50 \%\) of the students. The NRCs had considerable flexibility in selecting items and may have considered items inappropriate for other reasons. All participating countries except Thailand returned the information for analysis.

\footnotetext{
See Appendix A for more information on the test development.
\({ }^{2}\) Because there also may be curriculum areas covered in some countries that are not covered by the TIMSS tests, the TCMA does not provide complete information about how well the TIMSS tests cover the curricula of the countries.
}

Tables B. 1 and B. 2 present the TCMA results for the eighth and seventh grades, respectively. The first row of each table indicates that at both grades the countries varied substantially in the number of items considered appropriate. At the eighth grade, half of the countries indicated that items representing \(90 \%\) or more of the score points ( 145 out of a possible 162) were appropriate, \({ }^{3}\) with the percent ranging from \(100 \%\) in Hungary and the United States to \(47 \%\) ( 76 score points) in Greece. Although, in general, fewer items were selected at the seventh grade than at the eighth grade, nearly half of the countries selected items representing at least threequarters of the score points (121), and several countries selected items representing \(90 \%\) or more. The number of score points represented by the selected items for the seventh grade ranged from 59 (36\%) in Denmark to 162 ( \(100 \%\) ) in the United States. That somewhat lower percentages of items were selected for the TCMA at the seventh grade is consistent with the instrument-development process, which put more emphasis on the upper-grade curriculum.

Since most countries indicated that some items were not included in their intended curricula at the two grades tested, the question becomes whether the inclusion of these items had any effect on the international performance comparisons. \({ }^{4}\) The TCMA results provide a method for answering this question, providing evidence that it is reasonable to make cross-national comparisons on the basis of the TIMSS mathematics test.

Each of the first columns in Tables B. 1 and B. 2 shows the overall average percent correct for each country (as discussed in Chapter 2 and reproduced here for convenience in making comparisons). The countries are presented in the order of their overall performance, from highest to lowest. To interpret these tables, reading across a row provides the average percent correct for the students in the country identified by that row on the items selected by each of the countries named across the top of the table. For example, eighth-grade Korean students had an average of \(71 \%\) correct on the items that Singapore selected as appropriate for the Singaporean students, an average of \(72 \%\) percent correct on the items selected for the Japanese students, \(73 \%\) correct for its own items, \(72 \%\) on the items selected by Hong Kong, and so forth. The column for a country shows how each of the other countries performed on the subset of items selected for its own students. Using the set of items selected by Switzerland as an example, on average, \(80 \%\) of these items were answered correctly by the Singaporean students, \(75 \%\) by the Japanese students, \(72 \%\) by the students from Hong Kong, \(71 \%\) by the Belgian (Flemish) students, and so forth. The shaded diagonal elements in

\footnotetext{
\({ }^{3}\) Of the 151 items in the test, some items were assigned more score points than others. In particular, some items had two parts, and some extended-response items were scored on a two-point scale and others on a three-point scale. The total number of score points available for analysis was 162. The TCMA uses the score points in order to give the same importance to items that they received in the test scoring.
\({ }^{4}\) It should be noted that the performance levels presented in Tables B. 1 and B. 2 are based on average percents correct as was done in Chapter 2 , which is different from the average scale scores that were presented in Chapter 1. The cost and delay of scaling would have been prohibitive for the TCMA analyses.

}
each table show how each country performed on the subset of items that it selected based on its own curriculum. Thus, the Swiss students themselves averaged \(64 \%\) correct responses on the items identified by Switzerland for the analysis.

The international averages presented across the last row of the tables show that the selection of items for the participating countries varied somewhat in average difficulty, ranging from \(54 \%\) to \(58 \%\) at the eighth grade and from \(48 \%\) to \(61 \%\) at the seventh grade. Despite these differences, the overall picture provided by both Tables B. 1 and B. 2 reveals that different item selections do not make a major difference in how well countries perform relative to each other. The items selected by some countries were more difficult than those selected by others. The relative performance of countries on the various item selections did vary somewhat, but generally not in a statistically significant manner. \({ }^{5}\)

Comparing the diagonal element for a country with the overall average percentage correct shows the difference between performance on this subset of items and performance on the test as a whole. In general, there were small increases in each country's performance on its own subset of items. To illustrate, the average percent correct for eighth-grade students in the Russian Federation is \(60 \%\). The diagonal element shows that Russian students had about the same average percent correct (62\%) based on the smaller set of items selected as relevant to the curriculum in the Russian Federation as they did overall. In the eighth grade, the differences were extremely small ( 2 average percentage points or less) for most countries. Only a few countries had an average percent correct on their own selected items more than 3 percentage points higher than their average on the test as a whole. Performance differences between the entire TIMSS test and the subset of items selected for the TCMA were, in general, somewhat larger for seventh-grade students, including several countries with average performance that was 5 to 10 percentage points higher on the items selected for the TCMA for their own students. The largest increase (16 average percentage points) was for the seventh-grade students in Denmark.

It is clear that the selection of items does not have a major effect on the general relationship among countries. Countries that had substantially higher or lower performance on the overall test in comparison to each other also had higher or lower relative performance on the different sets of items selected for the TCMA. At the eighth grade, Singapore, Japan, Korea, and Hong Kong were the highest-performing countries and in the same order of performance, both on the test as a whole and on all the different sets of item selections. At the seventh grade, Singapore had the highest average percent correct on the test as a whole and on all of the different item selections, with Japan, Korea, Hong Kong, and Belgium (Flemish) among the top five highest performing countries in all cases. Although there were some changes in

\footnotetext{
5 Small differences in performance in these tables are not statistically significant. The standard errors for the estimated average percent correct statistics can found in Tables B. 3 and B.4. We can say with 95\% confidence that the value for the entire population will fall between the sample estimate plus or minus two standard errors.
}
the ordering of countries based on the items selected for the TCMA, most of these differences are within the boundaries of sampling error. As the most extreme example, consider the 59 score points selected by Denmark for the seventh grade. Denmark did substantially better on these items than on the test as a whole, with \(60 \%\) correct responses to these items, on average, compared to only \(44 \%\) average correct on the test as a whole. However, all other countries also did better on these particular items, with an international average of \(61 \%\) for the items selected by Denmark compared with \(49 \%\) on the test as a whole. Also, for example, Scotland, Norway, and Latvia (LSS), which also averaged \(44 \%\) correct over all items at the seventh grade, performed similarly to Denmark on the set of items selected by Denmark - 58\%,59\%, and 56\%, respectively.

The TCMA results provide evidence that the TIMSS mathematics test provides a reasonable basis for comparing achievement for the participating countries. This result is not unexpected, since making the test as fair as possible was a major consideration in test development. The fact that the majority of countries indicated that most items were appropriate for their students means that the different average percent correct estimates were based substantially on the same items. Insofar as countries rejected items that would be difficult for their own students, these items tended to be difficult for students in other countries as well. The analysis shows that omitting such items improves the results for that country, but also tends to improve the results for all other countries, so that the overall pattern of results is largely unaffected.

\section*{-Appendix \(F\) \\ ACKNOWLEDGMENTS}

TIMSS was truly a collaborative effort among hundreds of individuals around the world. Staff from the national research centers, the international management, advisors, and funding agencies worked closely to design and implement the most ambitious study of international comparative achievement ever undertaken. TIMSS would not have been possible without the tireless efforts of all involved. Below, the individuals and organizations are acknowledged for their contributions. Given that implementing TIMSS has spanned more than seven years and involved so many people and organizations, this list may not pay heed to all who contributed throughout the life of the project. Any omission is inadvertent. TIMSS also acknowledges the students, teachers, and school principals who contributed their time and effort to the study. This report would not be possible without them.

\section*{MANAGEMENT AND OPERATIONS}

Since 1993, TIMSS has been directed by the International Study Center at Boston College in the United States. Prior to this, the study was coordinated by the International Coordinating Center at the University of British Columbia in Canada. Although the study was directed centrally by the International Study Center and its staff members implemented various parts of TIMSS, important activities also were carried out in centers around the world. The data were processed centrally by the IEA Data Processing Center in Hamburg, Germany. Statistics Canada was responsible for collecting and evaluating the sampling documentation from each country and for calculating the sampling weights. The Australian Council for Educational Research conducted the scaling of the achievement data.

\section*{International Study Center (1993-)}

Albert E. Beaton, International Study Director
Michael O. Martin, Deputy International Study Director
Ina V.S. Mullis, Co-Deputy International Study Director
Eugenio J. Gonzalez, Director of Operations and Data Analysis
Dana L. Kelly, Research Associate
Teresa A. Smith, Research Associate
Maryellen Harmon, Performance Assessment Coordinator
Robert Jin, Computer Programmer
William J. Crowley, Fiscal Administrator
Thomas M. Hoffmann, Art Director
Debora Galanti, Art Director (former)
Jonathan R. English, Systems Manager
José Rafael Nieto, Senior Production Specialist
Ann G.A. Tan, Conference Coordinator
Mary C. Howard, Office Supervisor
Cheryl L. Flaherty, Secretary

Raymond J. Adams, Principal Research Fellow
Margaret Wu, Research Fellow
Nikolai Volodin, Research Fellow
David Roberts, Research Officer
Greg Macaskill, Research Officer

\section*{FUNDING AGENCIES}

Funding for the International Study Center was provided by the National Center for Education Statistics of the U.S. Department of Education, the U.S. National Science Foundation, and the International Association for the Evaluation for Educational Achievement. Eugene Owen and Lois Peak of the National Center for Education Statistics and Larry Suter of the National Science Foundation each played a crucial role in making TIMSS possible and for ensuring the quality of the study. Funding for the International Coordinating Center was provided by the Applied Research Branch of the Strategic Policy Group of the Canadian Ministry of Human Resources Development. This initial source of funding was vital to initiate the TIMSS project. Tjeerd Plomp, Chair of the IEA and of the TIMSS Steering Committee, has been a constant source of support throughout TIMSS. It should be noted that each country provided its own funding for the implementation of the study at the national level.

\section*{NATIONAL RESEARCH COORDINATORS}

The TIMSS National Research Coordinators and their staff had the enormous task of implementing the TIMSS design in their countries. This required obtaining funding for the project; participating in the development of the instruments and procedures; conducting field tests; participating in and conducting training sessions; translating the instruments and procedural manuals into the local language; selecting the sample of schools and students; working with the schools to arrange for the testing; arranging for data collection, coding, and data entry; preparing the data files for submission to the IEA Data Processing Center; contributing to the development of the international reports; and preparing national reports. The way in which the national centers operated and the resources that were available varied considerably across the TIMSS countries. In some countries, the tasks were conducted centrally, while in others, various components were subcontracted to other organizations. In some countries, resources were more than adequate, while in others, the national centers were operating with limited resources. Of course, across the life of the project, some NRCs have changed. This list attempts to include all past NRCs who served for a significant period of time as well as all the present NRCs. All of the TIMSS National Research Coordinators and their staff members are to be commended for their professionalism and their dedication in conducting all aspects of TIMSS.

\section*{TIMSS ADVISORY COMMITTEES}

The International Study Center was supported in its work by several advisory committees. The International Steering Committee provided guidance to the International Study Director on policy issues and general direction of the study. The TIMSS Technical Advisory Committee provided guidance on issues related to design, sampling, instrument construction, analysis, and reporting, ensuring that the TIMSS methodologies and procedures were technically sound. The Subject Matter Advisory Committee ensured that current thinking in mathematics and science education were addressed by TIMSS, and was instrumental in the development of the TIMSS tests. The Free-Response Item Coding Committee developed the coding rubrics for the free-response items. The Performance Assessment Committee worked with the Performance Assessment Coordinator to develop the TIMSS performance assessment. The Quality Assurance Committee helped to develop the quality assurance program.

[^5]:    'Estimates for 1994 based, in most cases, on a de facto definition. Refugees not permanently settled in the country of asylum are generally considered to be part of their country of origin.
    ${ }^{2}$ Area is the total surface area in square kilometers, comprising all land area and inland waters.
    ${ }^{3}$ Density is population per square kilometer of total surface area.
    ${ }^{4}$ Number of years a newborn infant would live if prevailing patterns of mortality at its birth were to stay the same throughout its life.
    ${ }^{5}$ Gross enrollment of all ages at the secondary level as a percentage of school-age children as defined by each country. This
    may be reported in excess of $100 \%$ if some pupils are younger or older than the country's standard range of secondary school age.
    ${ }^{6}$ Annual Abstract of Statistics1995, and Office of National Statistics. All data are for 1993.
    ${ }^{7}$ Number for Secondary Enrollment is from Education Department (1985) Education Indicators for the Hong Kong Education System (unpublished document).
    ${ }^{8}$ Registrar General for Scotland Annual Report 1995 and Scottish Abstract of Statistics 1993.
    ( - ) A dash indicates the data were unavailable.
    SOURCE: The World Bank, Social Indicators of Development, 1996.

[^6]:    ${ }^{1}$ The levels of education are based on the International Standard Classification of Education. The duration of Primary (level 1) and Secondary (level 2) vary depending on the country.
    ${ }^{2}$ SOURCE: The World Bank Atlas, 1996. Estimates for 1994 at current market prices in U.S. dollars, calculated by the conversion method used for the World Bank Atlas.
    ${ }^{3}$ SOURCE: The World Bank Atlas, 1996. Converted at purchasing power parity (PPP). PPP is defined as number of units of a country's currency required to buy same amounts of goods and services in domestic market as one dollar would buy in the United States.
    ${ }^{4}$ SOURCE: UNESCO Statistical Yearbook, 1995. Calculated by multiplying the Public Expenditure on Education as a \% of GNP by the percentage of public education expenditure on the first and second levels of education. Figures represent the most recent figures released.
    ${ }^{5}$ Calculated by multiplying the GNP per Capita (Intl. Dollars) column by Public Expenditure on Education.
    ${ }^{6}$ GNP per capita figure for Cyprus is for 1993.
    ${ }^{7}$ The figures for England and Scotland are for the United Kingdom.
    ${ }^{8}$ Calculated using Education Department (1985) Education Indicators for the Hong Kong Education System (unpublished document).
    ( - ) A dash indicates the data were unavailable.

[^7]:    ${ }^{1}$ Spain: Spain is now reforming to a regionally centralized system with high responsibility at the school level.
    ${ }^{2}$ Switzerland: Decision-making regarding textbooks in upper secondary varies across the cantons and the types of education.
    ${ }^{3}$ Hungary: Hungary is in the midst of changing from a highly centralized system to one in which local authorities and schools have more autonomy.
    SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95. Information provided by TIMSS National Research Coordinators.

[^8]:    ${ }^{1}$ Denmark: Written examinations are set and marked centrally. The Ministry of Education sets the rules and framework for oral examinations.
    However, oral examinations are conducted by the pupil's own teacher, together with a teacher from another local school or an external (ministry-appointed) examiner.
    ${ }^{2}$ England: Centralized national curriculum assessments taken at Years 2, 6 and 9 . Regionally centralized examinations taken at Years 11 and 13.
    ${ }^{3}$ Hong Kong: Centralized examination taken at Year 11.
    ${ }^{4}$ Ireland: Centralized examinations taken at Grade 9 and Grade 12.
    ${ }^{5}$ Netherlands: School-leaving examinations consisting of a centralized part and a school-bound part are taken in the final grades of the four student ability tracks in secondary education.
    ${ }^{6}$ New Zealand: Centralized examinations taken at Years 11, 12 and 13. Centralized national monitoring at Years 4 and 8.
    ${ }^{7}$ Philippines: Centralized examinations taken at Grade 6 and Year 10 (4th year high school).
    ${ }^{8}$ Russian Federation: Centralized examinations taken in Grades 9 and 11 in mathematics and Russian/literature.
    ${ }^{9}$ Singapore: Centralized examinations taken at Grades 6,10, and 12.
    ${ }^{10}$ Australia: Not centralized as a country, but low-stakes statewide population assessments are undertaken in most states at one or more of Grades 3, 5, 6 and 10. In most states, centralized examinations are taken at Grade 12.
    ${ }^{11}$ Germany: Not centralized as a country, but is centralized within 6 (of 16) federal states.
    ${ }^{12}$ Israel: Centralized examinations taken at the end of secondary school that affect opportunities for further education.
    ${ }^{13}$ Latvia: Centralized examinations taken at Grade 9 and Grade 12.
    ${ }^{14}$ Slovenia: Two-subject national examination taken after Grade 8 (end of compulsory education); five-subject externally-assessed baccalaureat after Grade 12 for everyone entering university.
    ${ }^{15}$ Sweden: There are no examinations in Sweden.

[^9]:    ${ }^{1}$ TIMSS used item response theory (IRT) methods to summarize the achievement results for both grades on a scale with a mean of 500 and a standard deviation of 100 . Scaling averages students' responses to the subsets of items they took in a way that accounts for differences in the difficulty of those items. It allows students' performance to be summarized on a common metric even though individual students responded to different items in the mathematics test. For more detailed information, see the "IRT Scaling and Data Analysis" section of Appendix A.
    ${ }^{2}$ Achievement results for the eighth-grade students in Denmark and Sweden, as well as for the eighth-grade students in German-speaking schools in Switzerland are presented in Appendix D.

[^10]:    *Eighth grade in most countries; see Table 2 for information about the grades tested in each country
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    'National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%,
    Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^11]:    *Eighth grade in most countries; see Table 2 for information about the grades tested in each country
    ${ }^{\text {t}}$ Statistically significant at .05 level, adjusted for multiple comparisons.
    Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom
    sampling procedures (see Appendix A for details).

[^12]:    ${ }^{3}$ Tables of the percentile values and standard deviations for all countries are presented in Appendix E.
    ${ }^{4}$ See the "IRT Scaling and Data Analysis" section of Appendix A for more details about calculating standard errors and confidence intervals for the TIMSS statistics.
    ${ }^{5}$ Because the Flemish and French educational systems in Belgium participated separately, their results are presented separately in the tables in this report.

    - The significance tests in Figures 1.1 and 1.2 are based on a Bonferroni procedure for multiple comparisons that holds to $5 \%$ the probability of erroneously declaring the mean of one country to be different from another country.

[^13]:    ${ }^{7}$ Results are presented for 27 countries in the top portion of Table 1.2 because French-speaking Belgium and Scotland met the sampling requirements at this grade. Thirty-nine countries are presented in total because Kuwait and Israel tested only the eighth grade.

[^14]:    *Seventh grade in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%,
    Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^15]:    Mean achievement significantly lower than comparison country

[^16]:    *Seventh grade in most countries; see Table 2 for information about the grades tested in each country
    'Statistically significant at . 05 level, adjusted for multiple comparisons.
    Because coverage falls below $65 \%$, Latvia is annotated LSS for Latvian Speaking Schools only.
    Countries shown in italics did not satisfy one or more guidelines for sample participation rates, age/grade specifications, or classroom sampling procedures (see Appendix A for details).

[^17]:    ${ }^{8}$ Both the Flemish and French educational systems in Belgium have policies whereby lower-performing sixthgrade students continue their study of the primary school curriculum and then re-enter the system as part of a vocational track in the eighth grade. Since these lower-performing students are not included in the seventhgrade results, but do compose about $10 \%$ of the sample at the eighth grade, this contributed to reduced performance differences between the seventh and eighth grades.
    ${ }^{9}$ In South Africa, there is no structural reason to explain the relatively small difference between seventh- and eighth-grade performance. However, in 1995, its education system was undergoing radical reorganization from 18 racially-divided systems into 9 provincial systems.

[^18]:    *Seventh and eighth grades in most countries; see Table 2 for infomation about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some differences may appear inconsistent.

[^19]:    *Eighth grade in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some differences may appear inconsistent.

[^20]:    *Seventh grade in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some differences may appear inconsistent.

[^22]:    *Eighth grade in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details)
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^23]:    *Seventh grade in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^24]:    *Data are extrapolated; students below the lower grade and above the upper grade were not included in the sample. Denmark, Sweden and Switzerland tested 3 grades.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded, some totals may appear inconsistent.

[^25]:    ${ }^{1}$ Please see the test development section of Appendix A for more information about the process used to develop the TIMSS tests. Appendix B provides an analysis of the match between the test and curriculum in the different TIMSS countries and the effect of this match on the TIMSS results.
    ${ }^{2}$ TIMSS plans to generate IRT scale scores for the mathematics content areas for future reports.

[^26]:    ${ }^{3}$ Table A. 1 in Appendix A provides details about the distributions of items across the content areas, by format and score points (taking into account multi-part items and items scored for partial credit).
    ${ }^{4}$ The IRT scale scores provide better estimates of overall achievement, because they take the difficulty of items into account. This is important in a study such as TIMSS, where different students take overlapping but somewhat different sets of items.

[^27]:    *Seventh grade in most countries; See Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below $65 \%$, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^28]:    ${ }^{5}$ Since the items in the different content areas varied in difficulty, the first step was to adjust the average percents to make all content areas equally difficult so that the comparisons would not reflect the various difficulties of the items in the content areas. The next step was to subtract these adjusted percentages for each content area from a country's average percentage over all six content areas. If the overall percentage of correct items by students in a country was the same as the adjusted average for that country for each of the content areas, then these differences would all be zero. The standard errors for these differences were computed, and then each difference was examined for statistical significance. This approach is similar to testing interaction terms in the analysis of variance. The jackknife method was used to compute the standard error of each interaction term. The significance level was adjusted using the Bonferroni method, assuming $6 \times 41$ (content areas by countries) comparisons at the eighth grade and $6 \times 39$ at the seventh grade.

    - The statistics are not independent. That is, a country cannot do better (or worse) than its average on all scales, since a country's differences must add up to zero. However, it is possible for a country to have no statistically significant differences in performance.

[^29]:    *Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{\prime}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below $65 \%$, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    Because results are rounded to the nearest whole number, some totals may appear inconsistent.
    SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

[^30]:    *Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is
    annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    Because results are rounded to the nearest whole number, some totals may appear inconsistent.
    SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

[^31]:    *Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below $65 \%$, Latvia is
    annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    Because results are rounded to the nearest whole number, some totals may appear inconsistent.
    SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1994-95.

[^32]:    ${ }^{8}$ Robitaille, D.F. (1989). "Students' Achievements: Population A" in D.F. Robitaille, and R.A. Garden (eds.), The IEA Study of Mathematics II: Contexts and Outcomes of School Mathematics. New York: Pergamon Press.

[^33]:    *Seventh grade in most countries; See Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below $65 \%$, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

[^34]:    ' The IEA retained about one-third of the TIMSS items as secure for possible future use in measuring international trends in mathematics and science achievement. All remaining items are available for general use.
    ${ }^{2}$ The three-digit item label shown in the lower right corner of the box locating each example item on the item difficulty map refers to the original item identification number used in the student test booklets.

[^35]:    *Seventh and eighth grades in most countries; See Table 2 for information about the grades tested in each country.
    ${ }^{\dagger}$ Met guidelines for sample participation rates only after replacement schools were included (see Appendix A for details).
    ${ }^{1}$ 'National Desired Population does not cover all of International Desired Population (see Table A.2). Because coverage falls below 65\%, Latvia is annotated LSS for Latvian Speaking Schools only.
    ${ }^{2}$ National Defined Population covers less than 90 percent of National Desired Population (see Table A.2).
    ( ) Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent. A dash (-) indicates data are not available. Israel and Kuwait did not test at the seventh grade. Internationally comparable data are unavailable for France on Example 4 and Japan on Example 5.

[^36]:    *Seventh and eighth grades in most countries; see Table 2 for information about the grades tested in each country. NOTE: Each item was placed onto the TIMSS international mathematics scale based on students' performance in both grades. Items are shown at the point on the scale where students with that level of proficiency had a 65 percent probability of providing a correct response.
