Organizations and Individuals Responsible for TIMSS 2011

Foreword

In both technologically advanced and developing economies, understanding educational outcomes is central to effective educational planning and reform. Further, in today's global innovation economy, competence in mathematics and science remains an educational imperative.

For more than 50 years, the International Association for the Evaluation of Educational Achievement (IEA) has been conducting comparative studies of educational achievement in a number of curriculum areas, including mathematics and science. TIMSS 2011 represents the fifth cycle of the Trends in International Mathematics and Science Study (TIMSS), developed by IEA. During the past two decades, TIMSS has reported on mathematics and science achievement trends at the fourth and eighth grades, providing educational policymakers, administrators, teachers, and researchers with powerful insights into how educational systems are functioning as well as critical intelligence about the possibilities for educational reform and improvement.

The *TIMSS 2011 International Results in Science* presents extensive information on student performance in science, including trends over the five assessments since 1995. Also included are data on performance in the science content domains (earth science, biology, chemistry, etc.) and on competence in managing the problem solving challenges

in these science contexts. In addition, the TIMSS 2011 report contains vital information on key curricular, instructional, and resource-related factors that can impact the teaching and learning process. These data on student achievement trends and the contexts for teaching and learning science will ensure that TIMSS continues to set the standard for studies of this type and be regarded as a fundamental source of information for educational policymakers, planners, and researchers alike.

TIMSS requires and represents a significant commitment of resources and dedication to achieve a common vision. Clearly, projects of this magnitude rely on the cooperation and support of a large number of individuals, institutions, and organizations around the world. IEA is particularly indebted to the staff members of the TIMSS & PIRLS International Study Center at Boston College, who have been charged with the overall leadership of this project. Their contributions have been augmented by the staff of the IEA Data Processing and Research Center, the IEA Secretariat, Statistics Canada, and Educational Testing Service, for whose support I am also extremely grateful. While the work of the staff of this consortium makes projects like TIMSS possible, the continued leadership and direction of the TIMSS Executive Directors Ina Mullis and Michael Martin remain central to the success of this project.

In addition, projects of this size are possible only with considerable financial support. I am particularly grateful for support from IEA's major funding partners, including the US National Center for Education Statistics, the World Bank, and the many self-funding countries without which this project would not have been possible. I also wish to thank Boston College for its continued support of the TIMSS & PIRLS International Study Center.

Finally, as always, TIMSS would not have been possible without the National Research Coordinators and their colleagues, whose responsibility it was to manage the study at the local level, and the participation of the many teachers, students, and policymakers around the world who gave freely of their time in the interest of advancing our common understanding of reading achievement. On behalf of all who benefit from the use of the information provided by TIMSS, we are thankful for this commitment.

Hans Wagemaker
Executive Director, IEA

Executive Summary

TIMSS is an international assessment of mathematics and science at the fourth and eighth grades that has been conducted every four years since 1995. In 2011, nationally representative samples of students in 63 countries and 14 benchmarking entities (regional jurisdictions of countries, such as states) participated in TIMSS. Countries and benchmarking participants could elect to participate in the fourth grade assessment, the eighth grade assessment, or both: fifty-two countries and seven benchmarking entities participated in the fourth grade assessment, and 45 countries and 14 benchmarking entities participated in the eighth grade assessment. Several of the countries, where fourth and eighth grade students were expected to find the TIMSS assessments too difficult, administered the fourth and eighth grade assessments to their sixth and ninth grade students.

In total, more than 600,000 students participated in TIMSS 2011. TIMSS 2011 continues the series of international assessments in mathematics and science conducted by the International Association for the Evaluation of Educational Achievement (IEA).

IEA pioneered international comparative assessments of educational achievement in the 1960s to gain a deeper understanding of the effects of policies and practices across countries' different systems of education. TIMSS is directed by IEA's TIMSS & PIRLS International Study Center at Boston College.

The TIMSS science assessment is based on a comprehensive framework developed collaboratively with the participating countries that is organized around two dimensions:

- ♦ A content dimension specifying the domains or subject matter to be assessed within science; and
- ♦ A cognitive dimension specifying the domains or thinking processes expected of students as they engage with the science content.

The content domains and topic areas within them are different for the fourth and eighth grades, but the cognitive domains are the same for both grades, encompassing a range of cognitive processes involved in solving problems throughout the primary and middle school years.

Fourth Grade Content Domains	Eighth Grade Content Domains
45% Life Science	35% Biology
35% Physical Science	20% Chemistry
20% Earth Science	25% Physics
	20% Earth Science
Fourth Grade Cognitive Domains	Eighth Grade Cognitive Domains
40% Knowing	35% Knowing
40% Applying	35% Applying
20% Reasoning	30% Reasoning

Given the frameworks' broad coverage goals, the science assessment item pools were necessarily large—172 and 217 assessment items at the fourth and eighth grades, respectively—with about half being multiple choice and half being constructed response items where students write their answers. The achievement results are reported on

the TIMSS achievement scales for the fourth and eighth grades, each with a range of 0–1,000 (although student performance typically ranges between 300 and 700). TIMSS uses the centerpoint of the scale (500) as a point of reference that remains constant from assessment to assessment.

East Asian Countries Among the Top-performers in TIMSS 2011

Korea and Singapore were the top-performing countries in science in TIMSS 2011 at the fourth grade, followed by Finland, Japan, the Russian Federation, and Chinese Taipei. At the eighth grade, Singapore had the highest average achievement. The next highest-performing countries—Korea, Chinese

Taipei, and Japan—had higher achievement than all other countries except Singapore. Finland was the next highest-performing country.

Top-performing Countries in TIMSS 2011

Fourth Grade	Eighth Grade
Korea	Singapore
Singapore	Chinese Taipei
Finland	Korea
Japan	Japan
Russian Federation	Finland
Chinese Taipei	

of Alberta had performance similar to these countries. At the eighth grade, Slovenia, the Russian Federation, Hong Kong SAR, and England also were included in the top nine high-achieving countries. The US state of Massachusetts was outperformed only by Singapore, and the states of Minnesota, Colorado, Indiana, Connecticut, North Carolina, and Florida as well as the Canadian province of Alberta also had high achievement, comparable to the top nine countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lower-performing countries. Twenty-seven countries at the fourth grade had average achievement above the TIMSS scale centerpoint of 500, as did five benchmarking participants. At the eighth grade, 16 countries and ten benchmarking participants had average achievement above 500.

More Increases Than Decreases, Particularly at the Fourth Grade

At the fourth grade, 17 countries and three benchmarking participants have comparable data from 1995 and 2011, providing trends over the past 16 years. Since 1995, eight of these countries raised their levels of science achievement and only one had a decrease. Among the benchmarking participants, the Canadian province of Ontario increased achievement and the province of Québec decreased achievement between 1995 and 2011.

Trends Between 1995 and 2011, Fourth Grade

Countries Improving	Countries Declining
Hong Kong SAR	Norway
Hungary	
Iran	
Japan	
Korea	
Portugal	
Singapore	
Slovenia	

At the eighth grade, there was more balance between science achievement growth and decline among countries, although more countries had increases than at the fourth grade. Of the 25 countries and eight benchmarking participants with comparable data spanning from 1995 or 1999 to 2011, eleven countries had increased achievement and six countries had decreased achievement. In addition, three benchmarking participants had increased achievement—the Canadian province of Ontario and the US states of Massachusetts and North Carolina—while the Canadian province of Québec had decreased achievement.

Trends Between 1995 or 1999* and 2011, Eighth Grade

Countries Improving	Countries Declining
Chile	Hungary
Hong Kong SAR	Macedonia
Iran	Malaysia
Japan	Norway
Korea	Sweden
Lithuania	Thailand
Russian Federation	
Singapore	
Slovenia	
Tunisia	
United States	

*The 1999 assessment only was given at the eighth grade, and a number of countries joined at that time.

Overview of TIMSS 2011 International Benchmarks, Fourth Grade

Advanced
• Apply understanding of scientific processes and show knowledge of scientific inquiry.
High
• Apply knowledge and understanding to explain phenomena in everyday and abstract contexts.
Intermediate
• Have basic knowledge and understanding of practical situations in the sciences.
Low
• Show some elementary knowledge of life, physical, and earth sciences.

Overview of TIMSS 2011 International Benchmarks, Eighth Grade

Advanced
• Communicate an understanding of complex and abstract concepts in biology, chemistry, physics, and earth science.
High
• Demonstrate understanding of concepts related to science cycles, systems, and principles.
Intermediate
• Apply understanding of basic scientific knowledge in various contexts.
Low
• Recognize some basic facts from the life and physical sciences.

This report contains a number of items illustrating performance at the TIMSS International Benchmarks at the fourth and eighth grades.

Trends at TIMSS International Benchmarks

TIMSS reports achievement at four points along the scale as international benchmarks: Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400). At the fourth grade, reflecting the upward trends in average achievement, there were more improvements across the International Benchmarks in 2011 than there were declines. Six countries showed improvement at all four benchmarks between 1995 and 2011, raising the level of performance across the entire distribution of student achievement.

Reflecting less improvement across countries at the eighth grade, three countries declined since 1995 at all four benchmarks (Hungary, Sweden, and Norway), and only three countries improved at all four benchmarks.

High Percentages of East Asian Students Reach TIMSS International Benchmarks

At the fourth grade, Singapore and Korea, the two countries with the highest average science achievement, also were the countries with the largest percentages of students reaching the Advanced International Benchmark. One-third of the Singaporean students reached this advanced level of performance, as did 29 percent of students in Korea. Twenty percent of the students in Finland reached this level, followed by the Russian Federation (16%), Chinese Taipei (15%), the United States (15%), and Japan (14%). Although relatively few students reached the Advanced International Benchmark in most countries (median percentage across countries: 5%), the high median percentage reaching the Low International Benchmark (92%) indicates that many countries have been successful in educating almost all of their fourth grade students to a basic level of science achievement.

At the eighth grade, four East Asian countries had the largest percentages of students reaching the Advanced International Benchmark: Singapore had the highest percentage (40%), followed by Chinese Taipei (24%), Korea (20%), and Japan (18%). Next, the Russian Federation and England had 14 percent of their students reaching the Advanced Benchmark; Slovenia and Finland had 13 percent reaching this level. Several of the US states had similarly high percentages of students reaching the Advanced Benchmark, including Massachusetts (24%), Minnesota (16%), Colorado (14%), Connecticut (14%), and Florida (13%). In comparison to the fourth grade, the percentage of eighth grade students reaching each of the International Benchmarks was lower. For example, the median percentage of students reaching the Low International Benchmark was 79 percent (compared to 92% at the fourth grade), indicating that more eighth grade students were being “left behind” their classmates.

Countries with Increases at All Four TIMSS International Benchmarks between 1995 and 2011, Fourth Grade

Singapore	Portugal
Korea	Slovenia
Hong Kong SAR	Iran

More Countries Demonstrate Relative Strength in Knowing Science Than in Applying Scientific Knowledge or Reasoning

Generally, TIMSS 2011 participants with the highest achievement overall also had the highest achievement in the science content domains (e.g., biology and physics). Internationally, more countries demonstrated relative strengths in knowing science (i.e., recalling/recognizing, defining, and describing) than in applying scientific knowledge and reasoning.

Home Resources Strongly Related to Science Achievement

Research consistently shows a strong positive relationship between achievement and indicators of socioeconomic status, such as parents' or caregivers' level of education. At the fourth and sixth grades, TIMSS used the parents' reports on the availability of key home resources to create the Home Resources for Learning scale, including parents' education, parents' occupation, books in the home, and

study supports. Internationally, on average, almost three-quarters of the fourth grade students (74%) had **Some Resources**, and the 17 percent of students with **Many Resources** had substantially higher science achievement than the nine percent with **Few Resources**—a 131-point difference.

At the eighth and ninth grades, TIMSS asked the students themselves about their parents' education, books in the home, and study supports, with similar results. Internationally, the twelve percent of eighth grade students with **Many Resources** had the highest average achievement, the two-thirds with **Some Resources** had the next highest achievement, and the one-fifth with **Few Resources** had the lowest average achievement.

Successful Schools Tend to Be Well-resourced

Ever since the Coleman report in 1966, researchers have recognized that the compositional characteristics of a school's student body can affect student achievement. To provide information on this topic, TIMSS routinely asks school principals to report on their students' economic home backgrounds and home language. While there was variation across countries, higher average science achievement was associated with students attending schools where a greater percentage of students had the following characteristics:

- ◆ Were from relatively affluent socioeconomic backgrounds; and
- ◆ Spoke the language of the TIMSS assessment as their first language.

For example, students were distributed relatively equally across three types of schools categorized by the affluence of their home backgrounds. At the fourth grade, 36 percent attended schools with relatively more students from affluent than from economically disadvantaged homes, and these students had the highest average achievement. At the other end of the range, 30 percent of students attended schools with relatively more students from economically disadvantaged homes, and these students had the lowest average achievement.

Similarly, at the eighth grade, 32 percent attended schools with relatively more students from affluent than disadvantaged homes, and these students had the highest average achievement. Conversely, 36 percent of students attended schools with relatively more students from economically disadvantaged homes, and these students had the lowest average achievement.

Instruction Affected by Science Resource Shortages—International Averages **TIMSS 2011** **4th Grade** **Science**

Instruction Affected by Science Resource Shortages—International Averages **TIMSS 2011** **8th Grade** **Science**

Successful schools also are likely to have better working conditions and facilities as well as more instructional materials, such as books, computers, technological support, and supplies. TIMSS 2011 created the Science Resource Shortages scale based on principals' responses concerning inadequacies in general school resources (materials, supplies, heating/cooling/lighting, buildings, space, and staff) as well as resources specifically targeted to support science instruction (specialized teachers, computers, computer software, calculators, library materials, and audio-visual resources). Many countries were fortunate to have very few,

if any, students in schools where instruction was **Affected A Lot** by resource shortages. However, this was a crucial problem in some countries. At both the fourth and eighth grades, the one-quarter of students in schools **Not Affected** by resource shortages had higher average science achievement than their counterparts in less well-resourced schools. For students at the sixth and ninth grades, there was more impact from lack of resources, with greater percentages of students in schools **Affected A Lot** by resource shortages.

Successful Schools Emphasize Academic Success and Have Safe and Orderly Environments

Students with the highest science achievement typically attend schools that emphasize academic success, as indicated by rigorous curricular goals, effective teachers, students that desire to do well, and parental support. Both principals and teachers answered the questions comprising the School Emphasis on Academic Success scale, and both were extremely positive and remarkably similar in their responses. At both the fourth and eighth grades, there was a direct correspondence between average science achievement and principals' reports, with higher emphasis on academic success related to higher average science achievement.

Principals' School Emphasis on Academic Success—International Averages **TIMSS 2011** **4th Grade** Science

TIMSS 2011
Science 4th Grade

Principals' Problems with School Discipline and Safety—International Averages

TIMSS 2011
Science 8th Grade

In contrast, schools with discipline and safety problems are not conducive to high achievement. The sense of security that comes from attending a school with few behavior problems and having little or no concern about student or teacher safety promotes a stable learning environment. To create the School Discipline and Safety scale, principals provided their perceptions about the degree to which a series of ten discipline, disorderly, and bullying behaviors were problems in their schools.

At both the fourth and eighth grades, students who attended schools with disorderly environments and who reported more frequent bullying had much lower achievement than their counterparts in safe and orderly schools. Interestingly, across the fourth grade countries, 61 percent

of students, on average, attended schools with **Hardly Any Problems** with discipline or safety, 29 percent were in schools with **Minor Problems**, and 11 percent attended schools with **Moderate Problems**.

Across the eighth grade countries, however, discipline appeared to be more of an issue; principals reported that only 16 percent of students were in schools with **Hardly Any Problems**, 66 percent were in schools with **Minor Problems**, and 18 percent attended schools with **Moderate Problems**.

There is growing evidence that bullying in schools is on the rise, especially with the emergence of cyber-bullying, and that bullying does have a negative impact on students' educational achievement. The Students Bullied at School scale was based on how often students experienced six bullying behaviors, such as "Someone spread lies about me" and "I was made to do things I didn't want to do by other students."

At both the fourth and eighth grades, an increase in the frequency of bullying was related to a decrease in average science achievement. Unsettlingly, across countries, although nearly half of the fourth grade students reported **Almost Never** being bullied (48%), the majority were bullied either **About Monthly** (32%) or **About Weekly** (20%).

In contrast to principals' reports of more school discipline and safety problems at the eighth grade than fourth grade, the eighth grade students reported experiencing somewhat less bullying behavior than the fourth grade students.

Teacher Preparation and Career Satisfaction Related to Higher Science Achievement

In view of the importance of a well-prepared teaching force to an effective education, TIMSS 2011 collected a variety of information about teacher education. Internationally, most students were taught by the following:

- ♦ Teachers with bachelor's or postgraduate university degrees (80% at the fourth grade, and 90% at the eighth grade);
- ♦ Teachers with at least 10 years of experience (70% at the fourth grade, and 62% at the eighth grade);
- ♦ Teachers who reported being **Very Well** prepared to teach the TIMSS science topics (62% at the fourth grade, and 72% at the eighth grade); and
- ♦ Teachers **Very Confident** in teaching science (59% at the fourth grade, 73% at the eighth grade).

At both the fourth and eighth grades, students with more experienced and more confident teachers had higher science achievement.

The TIMSS 2011 Teacher Career Satisfaction scale categorized students based on their teachers' degree of agreement with six statements, such as "I do important work as a teacher" and "I plan to continue as a teacher for as long as I can." At both the fourth and eighth grades, teacher satisfaction was positively related to average science achievement, and very few students had teachers that expressed any dissatisfaction except in a small number of countries.

Internationally, the fourth grade students with **Satisfied** science teachers (54%) had higher achievement than those with teachers that were only **Somewhat Satisfied** (41%) or **Less Than Satisfied** (5%). The eighth grade science teachers reported somewhat lower levels of career satisfaction, with the 47 percent of students taught by **Satisfied** science teachers having higher science achievement than those taught by only **Somewhat Satisfied** (45%) or **Less Than Satisfied** (8%) teachers.

Students with Positive Attitudes Toward Science Have Higher Achievement, but Attitudes Less Positive at the Eighth Grade

Each successive TIMSS assessment has shown a strong positive relationship within countries between student attitudes toward science and their science achievement. The relationship is bidirectional, with attitudes and achievement mutually influencing each other.

The Students Like Learning Science scale was based on students' degree of agreement with six statements, such as "I enjoy learning science" and "I learn many interesting things in science." Internationally, more than half of the fourth grade students **Like Learning Science**, and they had higher average achievement than those that **Somewhat Like Learning Science** (35%) or those that **Do Not Like Learning Science** (12%).

At the eighth grade, 16 of the TIMSS countries teach science subjects separately (i.e., biology, chemistry, physics, and earth science) rather than as a general or integrated subject. TIMSS asked students in these countries about their liking of the individual subjects and the results were scaled separately for each subject. Compared to the fourth grade, substantially fewer eighth grade students reported positive attitudes toward learning science. Among countries teaching general or integrated science, only about one-third (35%) of students **Like Learning Science**, compared to 53 percent at the fourth grade. Accompanying this decrease is a widening achievement gap between students who like learning the subject (515, on average) and those who do not (450).

Among separate science subject countries, the average percentage of students liking learning biology (36%) and earth science (33%) was similar to the percentage liking learning science in general or integrated science countries, but fewer students like learning chemistry (25%) or physics (26%). In all four science subjects, the students who liked learning the subject had higher average achievement than those who only somewhat liked or did not like learning it.

The Students Confident in Science scale includes six statements (nine at the eighth grade), such as "Science is harder for me than for many of my classmates"(reverse coded) and "My teachers tells me I am good at science." Internationally, just 43 percent of the fourth grade students expressed confidence in their science ability, but their science achievement was higher than for the students who felt **Somewhat Confident**. The students lacking confidence (21%) had the lowest achievement.

At the eighth grade, only 20 percent of the students in general or integrated science countries, on average internationally, felt **Confident** in their science ability, with most students either **Somewhat Confident** (49%) or **Not Confident** (31%). The achievement gap was 86 points between the **Confident** and **Not Confident** students.

The eighth grade students in separate science countries were similar to students in general or integrated countries in their confidence in biology and earth science (21% and 19% **Confident**, respectively) but less confident in chemistry and physics (14% **Confident** for each). In all four science subjects, there was a strong positive relationship between student confidence and average science achievement.

The Students Value Science scale asked the eighth grade students about six different aspects of valuing science, including "I think learning science will help me in my daily life" and "I need to do well in science to get the job I want." Internationally, the eighth grade students in general or integrated science countries placed a high value on science, with 41 percent who **Value** science and another 33 percent who **Somewhat Value** the subject. However, about one-fourth (26%) **Do Not Value** science. Students who said they value science had higher average achievement than students who only valued it somewhat, and those students, in turn, had higher achievement than students who did not value science.

Students in separate science subject countries do not seem to value the individual science subjects in the same way as students in general science countries. Across the four science subjects, only about one-fourth (25–29%) of the students reported that they value the subjects and about two-fifths (36–42%) reported that they did not value them.

More Time for Science Instruction in Countries Teaching Science as Separate Subjects

On average at the fourth grade, countries reported devoting 85 hours per year to science instruction, although the amount of instructional time varied widely. Instructional time for science was much greater at the eighth grade, 158 hours per year on average, mainly because of the greater attention given to science instruction in the separate science countries. These countries devote 54 to 59 hours per year, on average, to each science subject, for an overall average of 225 hours of science instruction per year.

Engaging Instruction Related to Higher Science Achievement

Historically, educational studies, including TIMSS, have struggled to link student achievement to instructional activities. Typically, teachers are asked to report how frequently they use various instructional activities and strategies, and such information can be very useful. However, in light of the growing body of evidence about the complexities of teaching and learning, researchers are beginning to understand that these lists of activities cannot be used as proxies for the characteristics of good teaching.

To help build a better bridge between curriculum and instruction, TIMSS 2011 collected information about the concept of student engagement in learning, which focuses on the cognitive interaction between the student and the instructional content. To measure aspects of student engagement, TIMSS 2011 developed both a teacher scale, called the Engaging Students in Learning scale, and a student scale, called the Engaged in Science Lessons scale.

For the Engaging Students in Learning scale, students were categorized according to how often their teachers reported using six instructional practices (four at the eighth grade) intended to interest students and reinforce learning (e.g., summarizing the lesson's learning goals, questioning to elicit reasons and explanations, and bringing interesting things to class). Many fourth grade students internationally (71%) had science teachers that made efforts to use these practices to engage them during **Most Lessons**, and the rest had teachers that used such practices in **About Half the Lessons** (with a few exceptions). Internationally, at the eighth grade, 80 percent of students had teachers that reported using the instructional practices to engage students during **Most Lessons**.

From the students' perspective, the Engaged in Science Lessons scale asked how much students agreed with five statements, such as "I know what my teacher expects me to do" and "I am interested in what my teacher says." Internationally, the fourth grade students **Engaged** in their science lessons (45%) had the highest achievement, followed by those **Somewhat Engaged** (47%) and the few students **Not Engaged** (8%). At the eighth grade, internationally, smaller percentages of students reported being **Engaged**. In countries teaching

general or integrated science, only 29 percent of students, on average, reported being **Engaged** during their science lessons, although these students had the highest average achievement. Among the separate science subject countries, students reported somewhat more engagement in biology and earth science lessons (33% and 31% **Engaged**, respectively) than in chemistry and physics lessons

(26% and 27% **Engaged**, respectively). In each of the science subjects, students reporting being engaged in their lessons had higher science achievement than those who were only somewhat or not engaged.

Science Teachers Emphasizing Science Investigations

As noted in the TIMSS 2011 Science Assessment Framework, one of the ways in which students have been encouraged to build upon their knowledge and understanding of science is through the process of scientific inquiry, and the contemporary science curricula of many countries place considerable emphasis on engaging students in this process. The Emphasize Science Investigation scale was based on teacher reports of how often, in teaching science, they ask students to engage in six activities (seven at the eighth grade), such as "Observe natural phenomena such as the weather or a plant growing and describe what they see" and "Design or plan experiments or investigations."

On average across the fourth grade countries, 40 percent of students were taught by teachers emphasizing science investigation in **About Half the Lessons or More**, although teachers of science at the fourth grade vary widely across countries in their use of inquiry activities, with the percentage of students taught by teachers emphasizing science investigation ranging from 4 to 86 percent.

There was greater use of investigation in science instruction at the eighth grade, with almost half of the students (48%) taught by teachers emphasizing investigation in **About Half the Lessons or More**. Also, science achievement was slightly higher among students whose teachers more frequently emphasize inquiry activities (479 vs. 474).

Instruction Affected By Students Lacking in Basic Nutrition and Sleep

Finally, the characteristics of the students themselves can be very important to the classroom atmosphere. Unfortunately, some children in many countries around the world suffer from hunger, and a growing body of research, mostly in developing countries, is providing evidence that malnutrition has a negative impact on educational achievement. Similarly, a number of studies in a variety of countries have shown sleep duration and quality to be related to academic functioning at school.

On average, internationally, most fourth grade (71%) and eighth grade students (64%) were in classrooms where instruction was “not at all” limited because students were lacking in basic nutrition. These students had higher average science achievement than their peers in classrooms where instruction was limited “some or a lot” because students suffered from lack of basic nutrition. The percentage lacking in basic nutrition was much higher in some countries, including some of those that participated at the sixth and ninth grades.

Internationally, students suffering from some amount of sleep deprivation did have lower average science achievement. Teachers reported that only a scant majority of fourth grade students (54%) and not even half of the eighth grade students (42%), across countries, were in classrooms where instruction was “not at all” limited by students suffering from not enough sleep. Further, while there was considerable variation across countries, in a number of TIMSS 2011 countries and benchmarking participants at least two-thirds of students reportedly were at least somewhat sleep deprived.

Introduction

Science has direct application to nearly all aspects of life and society, from maintaining and improving human health to understanding and solving local, regional, and global environmental issues. Students need early development in science knowledge and thinking skills not only to be thoughtful citizens engaged in public discussions on important social issues involving science, but also to be prepared to make contributions through a wide range of careers in science, medicine, and technology. Thus, the study of science in the primary and early secondary grades provides a critical foundation for students' future careers and life success.

TIMSS (Trends in International Mathematics and Science Study) has the goal of helping countries make informed decisions about how to improve teaching and learning in mathematics and science. This TIMSS 2011 report summarizes the results of the TIMSS 2011 international science assessment of fourth and eighth grade students in countries around the world. As the fifth assessment in a regular program of student assessment conducted every four years since 1995, TIMSS 2011 provides participating countries with a wealth of information about trends in the science knowledge and skills of their students. At the heart of TIMSS is a wide-ranging state-of-the-art assessment of how well students master the essential science content, concepts, and procedures that countries expect them to learn as they progress through primary and lower secondary school.

Student achievement on the TIMSS 2011 science assessment is summarized in a variety of ways, beginning with trends over time in science achievement overall as well as its major component parts (e.g., biology, chemistry). The results also monitor progress toward the TIMSS International Benchmarks of science achievement—advanced, high, intermediate, and low. Recognizing that student science achievement is the result of a complex interplay of societal, school, and home environmental factors, this TIMSS science report embeds the achievement results in the context of the major influences on student learning, including the scope and coverage of the science curriculum, home support for student learning, school resources and learning climate, teacher preparation for science instruction, and student engagement in classroom learning.

Countries Participating in TIMSS 2011

IEA is an independent international cooperative of national research institutions and government agencies with nearly 70 member countries worldwide. IEA has a permanent secretariat based in Amsterdam, and a thriving data processing and research center in Hamburg (the IEA DPC). The decision to participate in an IEA study is coordinated through the IEA Secretariat in Amsterdam and made solely by each member country according to its own data needs and resources.

Exhibit 1 shows the 63 countries participating in TIMSS 2011, including some distinct education systems within countries that have always participated separately throughout IEA's long history (e.g., the Flemish-speaking part of Belgium and Hong Kong SAR). In addition, TIMSS 2011 included 14 benchmarking participants, including three Canadian provinces, nine US states, and two emirates from the United Arab Emirates. Countries and benchmarking participants could elect to participate in the fourth grade assessment, the eighth grade assessment, or both. Fifty-two countries and seven benchmarking participants administered the fourth grade assessment, and 45 countries and 14 benchmarking participants administered the eighth grade assessment.

Also, countries where students were expected to find the TIMSS assessments too difficult for their fourth or eighth grade students were given the option to assess students at a higher grade. Accordingly, three countries administered the fourth grade assessment to their sixth grade students and the eighth grade assessment to their ninth grade students.

Nationally representative samples of approximately 4,000 students from 150–200 schools participated in TIMSS 2011 at each grade level. More than

The TIMSS Trend Assessments in Mathematics and Science

IEA pioneered international comparative assessments of educational achievement to gain a deeper understanding of the effects of policies and practices across countries' different systems of education. IEA began its pioneering work in the 1960's with an international study of mathematics achievement, and mathematics has remained a major focus throughout its 50-year history of educational research. First administered in 1995, IEA's TIMSS is an integrated assessment of mathematics and science that has been conducted every four years since then. TIMSS is directed by IEA's TIMSS & PIRLS International Study Center at Boston College.

With assessments in 1995, 1999, 2003, 2007, and 2011, TIMSS has measured international student achievement in mathematics and science over a 16-year period, providing an unrivalled data resource for trends in mathematics and science achievement. All of the countries, institutions, and agencies involved in successive TIMSS assessments have worked collaboratively in building the most comprehensive and innovative measures of mathematics and science achievement possible, beginning in 1995 and improving with each successive assessment. Appendix A shows the participation in earlier TIMSS assessments by each TIMSS 2011 participant.

With its strong curricular focus and emphasis on policy-relevant information about the home, school, and classroom contexts, TIMSS is a valuable tool that countries can use to evaluate achievement goals and standards and monitor student achievement trends in an international context.

New Policy-relevant Context Questionnaire Scales

TIMSS 2011 provides extensive information about home supports and school environments for teaching and learning. In particular, in 2011 the trend cycles of IEA's TIMSS and PIRLS international assessments came together producing a synergy that led to advancements in the quality of background data collected by both projects. Because PIRLS (Progress in International Reading Literacy Study) also assesses students at the fourth grade, the alignment of the two projects provided the opportunity for countries to assess the same fourth grade students in reading, mathematics, and science in conjunction with the extensive background data collected by IEA assessments—most notably, allowing TIMSS

to benefit from the *PIRLS Learning to Read Survey*, completed by students' parents or caregivers.

Having almost 40 countries participate in both assessments required a great deal of coordination, innovation, and creativity, most notably in the area of background data collection. The *TIMSS 2011 Student Questionnaires*, *Teacher Questionnaires*, *School Questionnaires*, and *Curriculum Questionnaires* were developed jointly by TIMSS and PIRLS participants, including several joint meetings of the TIMSS 2011 Questionnaire Item Review Committee and the PIRLS 2011 Questionnaire Development Group. This effort yielded nearly 20 new context questionnaire scales about learning and teaching developed in parallel across reading, mathematics, and science. Underpinning a new approach to interpreting the questionnaire data, each context questionnaire scale was created using IRT methods, and results presented for three regions of the scale (most to least desirable) using scale score equivalents of response combinations to determine the cutpoints for the regions.

The TIMSS 2011 Science Assessment

The TIMSS 2011 science assessment is based on a comprehensive framework developed collaboratively with the participating countries. As described in the science chapter of the *TIMSS 2011 Assessment Frameworks* (Mullis, Martin, Ruddock, O'Sullivan, & Preuschoff, 2009), at each grade the science framework is organized around two dimensions: a content dimension specifying the domains or subject matter to be assessed within science, and a cognitive dimension specifying the domains or thinking processes to be assessed. The content domains and the topic areas within the domains are described separately for the fourth and eighth grades, with each topic area elaborated with specific objectives.

There are three content domains for the TIMSS 2011 fourth grade assessment:

- ◆ Life science;
- ◆ Physical science; and
- ◆ Earth science.

The eighth grade assessment has four content domains:

- ◆ Biology;
- ◆ Chemistry;

- ♦ Physics; and
- ♦ Earth science.

The following three cognitive domains describe the sets of thinking processes that students are likely to use as they engage with the science content:

- ♦ Knowing;
- ♦ Applying; and
- ♦ Reasoning.

These cognitive domains are the same for both grades, encompassing a range of cognitive processes involved in working scientifically and solving problems throughout the primary and middle school years.

Given the frameworks' broad coverage goals, the science assessment item pools were necessarily large—172 and 217 assessment items at the fourth and eighth grades, respectively—with approximately half multiple choice questions and half in a constructed response format in which students write their answers (see item counts by domain in Appendix B.1 and B.2). To keep response burden to a minimum, each student participating in the assessment responded to just a subset of the item pool, with IRT scaling used to estimate achievement on the assessment as a whole.

About 60 percent of the assessment items at each grade were retained from previous TIMSS assessments (2003 and 2007) to provide a foundation for measuring trends in science achievement across assessments; the remaining 40 percent were developed for TIMSS 2011.

Developing the assessment materials for TIMSS 2011 was a cooperative venture, involving the National Research Coordinators (NRCs) from the participating countries throughout the entire process. Having reviewed their national science curricula in the light of the TIMSS assessment approach, NRCs met to update the assessment framework for 2011 in terms of the balance of content and cognitive domain coverage and the assessment topics to be included. To develop the assessment items needed for the field test, the TIMSS & PIRLS International Study Center conducted an item-writing workshop for NRCs and their colleagues with particular backgrounds in science assessment and item development. Participating countries field tested the items and scoring guides with representative samples of students, and the results were scrutinized internally by the TIMSS 2011 panel of internationally recognized experts—the Science and Mathematics Item Review Committee.

Quality Assurance

The TIMSS science assessments were given to carefully selected and well-documented probability samples of students at the fourth and eighth grades. The student sampling for TIMSS 2011 was conducted with careful attention to quality and comparability. Staff from Statistics Canada and the IEA DPC worked with National Research Coordinators on all phases of the sampling activities. The Statistics Canada sampling experts, in conjunction with the TIMSS 2011 sampling referee (Keith Rust, Westat, Inc.), evaluated the quality of the samples and found high levels of compliance with sampling and participation requirements, with the exception of a few cases that are annotated in the report. Appendix C provides detail about the national target population coverage and sampling participation rates.

TIMSS 2011 made every effort to attend to the quality and comparability of the data through careful planning and documentation, cooperation among participating countries, standardized procedures, and rigorous attention to quality control throughout. For example, an extensive series of verification checks was conducted to ensure the comparability of the translations of the assessment items and questionnaires, detailed documentation was required to satisfy adherence to the sampling standards, and an ambitious quality assurance program was conducted to monitor the data collection.

TIMSS 2011 Reports

The results from TIMSS 2011 are presented in a series of major reports.

- ◆ This present report, *TIMSS 2011 International Results in Science*, summarizes fourth and eighth grade students' student achievement in each of the 63 participating countries and 14 regional benchmarking jurisdictions, and describes the educational contexts for science instruction. It includes trends in science achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003, and 2007 as well as student performance at the TIMSS International Benchmarks. Achievement results also are presented for science content and cognitive domains. The Science Report presents a rich array of information about students' backgrounds and attitudes toward science, the science curriculum, teachers' education and training, classroom characteristics and activities, and school contexts for science learning and instruction.

- ◆ As a complement to this volume, the *TIMSS 2011 International Results in Mathematics* (Mullis, Martin, Foy, & Arora, 2012) summarizes fourth and eighth grade students' mathematics achievement in each of the 63 participating countries and 14 regional benchmarking jurisdictions, and describes the educational contexts for mathematics instruction. It includes trends in mathematics achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003, and 2007 as well as student performance at the TIMSS International Benchmarks. Achievement results also are presented for mathematics content and cognitive domains. The Mathematics Report presents a rich array of information about students' backgrounds and attitudes toward mathematics, the mathematics curriculum, teachers' education and training, classroom characteristics and activities, and school contexts for mathematics learning and instruction.
- ◆ The *TIMSS 2011 Encyclopedia: Education Policy and Curriculum in Mathematics and Science, Volumes 1 and 2* (Mullis, Martin, Minnich, Stanco, Arora, Centurino, & Castle, 2012) describes national contexts for mathematics and science teaching and learning in the 63 countries and several of the regional benchmarking jurisdictions that participated in TIMSS 2011. A chapter prepared by each participant summarizes the structure of its education systems, the mathematics and science curricula and instruction in primary and secondary grades, the teacher education requirements, and the types of examinations and assessments employed. Together with selected supporting data about the countries curricula collected via online questionnaires, the chapters comprising the two volumes of the *TIMSS 2011 Encyclopedia* provide an important resource for helping to understand the teaching and learning of mathematics and science around the world, with particular emphasis on schooling through the eighth grade.
- ◆ The online publication, *Methods and Procedures in TIMSS and PIRLS 2011* (Martin & Mullis, 2012), describes the methods and procedures used to develop, implement, and analyze the results from TIMSS 2011 and is available from the TIMSS & PIRLS International Study Center's website: <http://timssandpirls.bc.edu>.

The fully documented TIMSS 2011 international database can be downloaded from the TIMSS & PIRLS International Study Center's website.

In addition, special analyses are being conducted using the TIMSS and PIRLS database of fourth grade students. This report, *TIMSS and PIRLS*

2011: Relationships among Reading, Mathematics, and Science Achievement—Implications for Early Learning, consists of in-depth analyses of fourth grade student achievement in reading, mathematics, and science in the countries that administered TIMSS and PIRLS to the same students in 2011. The report addresses four issues:

- ◆ Are primary schools providing a solid foundation in core subjects—reading, mathematics, and science?
- ◆ How does reading ability impact mathematics and science achievement?
- ◆ What are the characteristics of effective schools in reading, mathematics, and science? and
- ◆ How do homes support literacy and numeracy?

Chapter 1

International Student Achievement in Science

Korea and Singapore were the top-performing countries in science in TIMSS 2011 at the fourth grade, followed by Finland, Japan, the Russian Federation, and Chinese Taipei. At the eighth grade, Singapore had the highest average achievement, followed by Korea, Chinese Taipei, and Japan. Finland was the next highest-performing country.

Since 1995, fourth grade students have shown more improvement than reduction in science achievement (8 countries up vs. only 1 down), but improving eighth grade student achievement has been more difficult (11 up vs. 6 down).

Chapter 1 contains the science achievement results for the 52 countries and seven benchmarking participants in the fourth grade TIMSS 2011 assessment and the 45 countries and 14 benchmarking participants in the eighth grade TIMSS 2011 assessment. To summarize science achievement across the participants at fourth and eighth grades, the chapter provides:

- ◆ Averages (means) and distributions of science achievement;
- ◆ Trends in science achievement over time for participants in previous TIMSS assessments in 1995, 1999, 2003, and 2007;
- ◆ Trends across grades—Relative achievement of the 2007 fourth grade cohort as eighth grade students in 2011;
- ◆ Achievement differences by gender; and
- ◆ Trends in achievement differences by gender.

The results for percentages of students reaching the TIMSS International Benchmarks (Advanced, High, Intermediate, and Low) are presented in Chapter 2.

Science Achievement Across Countries

TIMSS 2011 Science Achievement

This section reports the TIMSS 2011 science results as average scores and distributions on the fourth and eighth grade TIMSS scales, each of which has a range of 0–1,000 (although student performance typically ranges between 300 and 700). The TIMSS science achievement scales were established in TIMSS 1995 based on the achievement distribution across all participating countries, treating each country equally. At each grade level, the scale centerpoint of 500 was set to correspond to the mean of the overall achievement distribution, and 100 points on the scale was set to correspond to the standard deviation. Achievement data from subsequent TIMSS assessment cycles were linked to these scales so that increases or decreases in average achievement may be monitored across assessments.¹ TIMSS uses the scale centerpoint as a point of reference that remains constant from assessment to assessment.

Exhibit 1.1 shows the distributions of student achievement for the participants in the TIMSS 2011 fourth grade assessment, including the average scale score with its 95 percent confidence interval and the ranges in performance for the middle half of the students (25th to 75th percentiles) as well as the extremes (5th and 95th percentiles). Similarly, Exhibit 1.2 shows the

¹ Please see *Methods and Procedures in TIMSS and PIRLS 2011* on the TIMSS and PIRLS website for further detail (<http://timssandpirls.bc.edu>).

distribution of science achievement for participants in the TIMSS 2011 eighth grade assessment.

The first page of Exhibit 1.1 presents the results for the 50 countries that assessed students at the TIMSS target population of the fourth grade. In particular, the TIMSS target population for the fourth grade assessment is the grade that represents four years of schooling, counting from the first year of ISCED Level 1.² Level 1 corresponds to primary education or the first stage of basic education, with the first year of Level 1 marking “systematic apprenticeship of reading, writing, and mathematics.” However, IEA has a policy that children should be at least 9 years old before being asked to participate in a paper-and-pencil assessment such as TIMSS. Thus, as a policy, TIMSS also tries to ensure that, at the time of testing, students do not fall under the minimum average age of 9.5 years old. So, England, Malta, and New Zealand, where students start school at a young age, were assessed in their fifth year of schooling, but still have among the youngest students and are reported together with the fourth grade countries. Exhibit C.1 in Appendix C shows the grades and average ages of the students tested across countries, together with information about the policies and practices related to age of entry to primary school across countries. The *TIMSS 2011 Encyclopedia* contains further details, such as countries’ policies about promotion and retention.

The second page of Exhibit 1.1 shows the results for three countries that assessed their sixth grade students. To meet the needs of the increasing number of developing countries wanting to participate in TIMSS 2011, the TIMSS & PIRLS International Study Center encouraged countries where the assessment was too difficult for fourth grade students to give the TIMSS fourth grade assessment at the sixth grade. The three countries that elected to assess sixth grade students were Botswana, Honduras, and Yemen (which also assessed its fourth grade students).

The second page of Exhibit 1.1 also presents the results for the TIMSS 2011 fourth grade benchmarking participants. The benchmarking participants followed the same procedures and met the same standards as the countries, the difference being that they are regional entities of countries. Benchmarking participants at the fourth grade included Florida and North Carolina (US states), Alberta, Ontario, and Québec (Canadian provinces), and Dubai and Abu Dhabi (emirates of the United Arab Emirates).

Following the same approach as Exhibit 1.1, the first page of Exhibit 1.2 presents the results for the 42 countries that assessed students at the TIMSS

2 ISCED stands for the International Standard Classification of Education developed by the UNESCO Institute for Statistics (OECD, 1999).

target population of the eighth grade, the grade that represents eight years of schooling. For the TIMSS eighth grade assessment, IEA has a policy that students should be at least 13 years old before being asked to participate. Thus, TIMSS tries to ensure that, at the time of testing, students do not fall under the minimum average age of 13.5 years old. So, England and New Zealand, where students start school at a young age, are reported together with the eighth grade countries. Exhibit C.1 in Appendix C shows the grades and average ages of students at the time of testing across countries, together with policies related to age of entry into school.

As with the fourth grade, the TIMSS & PIRLS International Study Center encouraged countries where the TIMSS eighth grade assessment was too difficult for eighth grade students to instead assess students at a higher grade. The second page of Exhibit 1.2 shows the results for three countries that assessed their ninth grade students—Botswana, Honduras, and South Africa.

The second page of Exhibit 1.2 also presents the results for the TIMSS 2011 eighth grade benchmarking participants. Benchmarking participants at the eighth grade included nine US states (Alabama, California, Colorado, Connecticut, Florida, Indiana, Massachusetts, Minnesota, and North Carolina), three Canadian provinces (Alberta, Ontario, and Québec), and two emirates (Dubai and Abu Dhabi).

For each section of Exhibit 1.1 and in Exhibit 1.2, participants are shown in decreasing order of average achievement. Also, there is a symbol by a participant's average scale score indicating if the average achievement is significantly higher (up arrow) or lower (down arrow) than the scale centerpoint of 500. TIMSS uses the centerpoint of the scale as a point of reference that remains constant from assessment to assessment. (In contrast, the international average, obtained by averaging across the mean scores for each of the participating countries, changes from assessment to assessment as the number and characteristics of the participating countries change.) Finally, several countries have annotations about 1) population coverage (detailed in Exhibit C.2); 2) sampling participation rates (explained in Exhibit C.8); and 3) the potential for bias in their achievement estimates (explained in the section after next).

Achievement in TIMSS 2011 at the Fourth Grade

The results in Exhibit 1.1 (first page) show that many countries performed well in TIMSS 2011 at the fourth grade, with 27 countries having higher achievement

than the scale centerpoint of 500 and several countries having average achievement above the High International Benchmark of 550. Because there are often relatively small differences between participants in average achievement, Exhibit 1.3 shows whether or not the differences in average achievement among the countries are statistically significant.

Korea and Singapore were the top-performing countries in TIMSS 2011 at the fourth grade. Looking at the results in Exhibit 1.1 and taking into account the information in Exhibit 1.3, it can be seen that these two countries performed similarly and had higher achievement than all of the other countries. The next highest-performing country was Finland, which had higher achievement than all countries except the two with the highest achievement, followed by Japan, the Russian Federation, and Chinese Taipei. The United States was the next highest performing country, with achievement higher than all countries except the six top performers. Also included in the top 14 high-achieving countries were the Czech Republic, Hong Kong SAR, Hungary, Sweden, the Slovak Republic, Austria, and the Netherlands. The benchmarking states of Florida and North Carolina and the province of Alberta had performance similar to these countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lower-performing countries. Eighteen countries had average achievement below the TIMSS centerpoint of 500. For the most part, these countries had average achievement above the Low (400) International Benchmark.

Very Low Performance on TIMSS 2011

It is a well-known principle of educational measurement that the difficulty of the items used to assess student achievement should match the ability of the students taking the assessment. In the context of assessing science achievement, measurement is most efficient when there is a reasonable match between the science ability level of the student population being assessed and the difficulty of the assessment items. The greater the mismatch, the more difficult it becomes to achieve reliable measurement. In particular, when the assessment tasks are much too challenging for most students, to the extent that many students are responding at chance level, it is extremely difficult to achieve acceptable measurement quality.

Monitoring trends over time is particularly problematic for a country with a high degree of mismatch between assessment difficulty and student

achievement. If there are substantial numbers of students with very low scores, their achievement is likely to be overestimated and consequently the overall achievement distribution becomes biased upwards. Educators and policy makers may work hard and make real strides in improving education from this assessment cycle to the next. However, because the achievement distribution at the earlier cycle was overestimated to begin with, the country would not see evidence of this improvement in the assessment results. The apparently poor return for all of the effort could be very disheartening to those who worked so hard and could prove a disincentive to further investment and effort.

Having substantial numbers of students with very low scores in a country also makes it difficult to estimate performance separately for the science content and cognitive domains. The items comprising the science reasoning scale were particularly difficult for such countries.

To identify countries where performance is deemed too low to provide reliable measurement of achievement and meaningful trend comparisons, the TIMSS & PIRLS International Study Center conducted extensive investigations to detect when the quality of measurement erodes (Martin, Mullis, & Foy, in press). The proportion of students unable to respond to any items on the assessment was selected as the best indicator of degree of mismatch between students' skills and those demanded by the assessment. Although the absolute lower limit would be no items answered correctly, about half the items were in multiple-choice format and guessing on these was possible. Thus, beginning in 2011, the criterion for having achievement too low for estimation was established based on the percentage of the students having a score no higher than what a student would achieve by guessing on all the multiple-choice questions—essentially the percentage of students performing below chance.

For each country, Appendix D shows the percentage of students with achievement too low for estimation (Exhibit D.1 for the fourth grade and D.2 for the eighth grade). When, as in Morocco and Yemen at the fourth grade, the percentage of students with achievement too low for estimation exceeded 25 percent, the country was annotated with the symbol Ж. Achievement trends are not reported for these countries because of concerns about bias in the estimation of achievement for the student population. When, as in Kuwait and Tunisia, the percentage of students with achievement too low for estimation exceeded 15 percent but did not exceed 25 percent, the country was annotated with the symbol Ψ, indicating reservations about the reliability of the achievement estimates.

Achievement in TIMSS 2011 at the Sixth Grade

As a group, the countries assessing their sixth grade students had average achievement between 345 and 432. This level of achievement is comparable to that of most of the lower performing countries at the fourth grade. Despite the low average achievement of the sixth grade students in Yemen, it is noteworthy that it exceeded the average achievement of Yemen's fourth grade students by more than 130 points.

Achievement in TIMSS 2011 at the Eighth Grade

The results in Exhibit 1.2 (first page) show that 16 countries had higher achievement than the scale centerpoint of 500 and five countries had average achievement above the High International Benchmark of 550—Singapore, Chinese Taipei, Korea, Japan, and Finland.

Looking at the results in Exhibit 1.2 and taking into account the information in Exhibit 1.4, which shows whether or not the differences in average achievement among the countries are statistically significant, it can be seen that Singapore had the highest average achievement, and had higher achievement than all other countries. The next highest-performing countries—Chinese Taipei, Korea, and Japan—had higher achievement than all other countries except Singapore. Also included in the top nine high-achieving countries were Finland, Slovenia, the Russian Federation, Hong Kong SAR, and England.

Several benchmarking participants had average science achievement close to the High International Benchmark (550). The state of Massachusetts was outperformed only by the top-performing country of Singapore, and the state of Minnesota was outperformed only by Singapore and Chinese Taipei, although both had achievement similar to a number of other countries.

While there were small differences from country to country, there was a substantial range in performance from the top-performing to the lower-performing countries. Twenty-four countries had average achievement below the scale centerpoint, mostly falling above the Low (400) International Benchmark. Among the eighth grade participating countries, only Ghana had many low performing students, with a percentage of students with achievement too low for estimation between 15 and 25 percent.

Achievement in TIMSS 2011 at the Ninth Grade

As a group, the countries assessing their ninth grade students had average achievement between 332 and 404, at or below the Low International Benchmark (400) for eighth grade students. There was evidence of many very low performing ninth grade students in South Africa, with the percentage of students with achievement too low for estimation between 15 percent and 25 percent.

Trends in Science Achievement

Exhibits 1.5 and 1.6 display changes in average science achievement at the fourth and eighth grades, respectively, for the countries and benchmarking participants that have comparable data from previous TIMSS assessments. For the fourth grade, there are 29 countries and four benchmarking participants having data from 1995, 2003, or 2007 that can be compared to 2011.³ Twelve countries and two benchmarking participants have trend data from all four TIMSS fourth grade assessments. For the eighth grade (and Finland at the seventh grade), there are 35 countries and nine benchmarking participants having data from 1995, 1999, 2003, or 2007 that can be compared to 2011, including eleven countries and two benchmarking participants that have data from all five TIMSS eighth grade assessments. With the participants shown in alphabetical order, Exhibits 1.5 and 1.6 show average achievement for each assessment year, as well as achievement differences between years, with an indication of statistical significance. The science achievement distributions also are shown for each assessment year.

At the fourth grade, there are 17 countries and three benchmarking participants that have comparable data from 1995 and 2011 providing trends over the past 16 years. Exhibit 1.7 shows these countries ordered from most to least growth in achievement over this period, to focus on educational progress across the TIMSS assessment years and complement the complete detail in Exhibit 1.5. Exhibit 1.7 presents for the fourth grade a country-by-country graphical depiction of change in average science achievement from 1995 to 2011, with growth curves aligned country by country to facilitate comparisons of change from assessment to assessment. That is, the same scale is used for each country (10-point intervals), but the part of the scale shown differs according to each countries' average achievement. To complement Exhibit 1.6 and focus on long-term educational progress at the eighth grade, Exhibit 1.8 presents for the eighth grade a similar depiction of change in average achievement from 1995

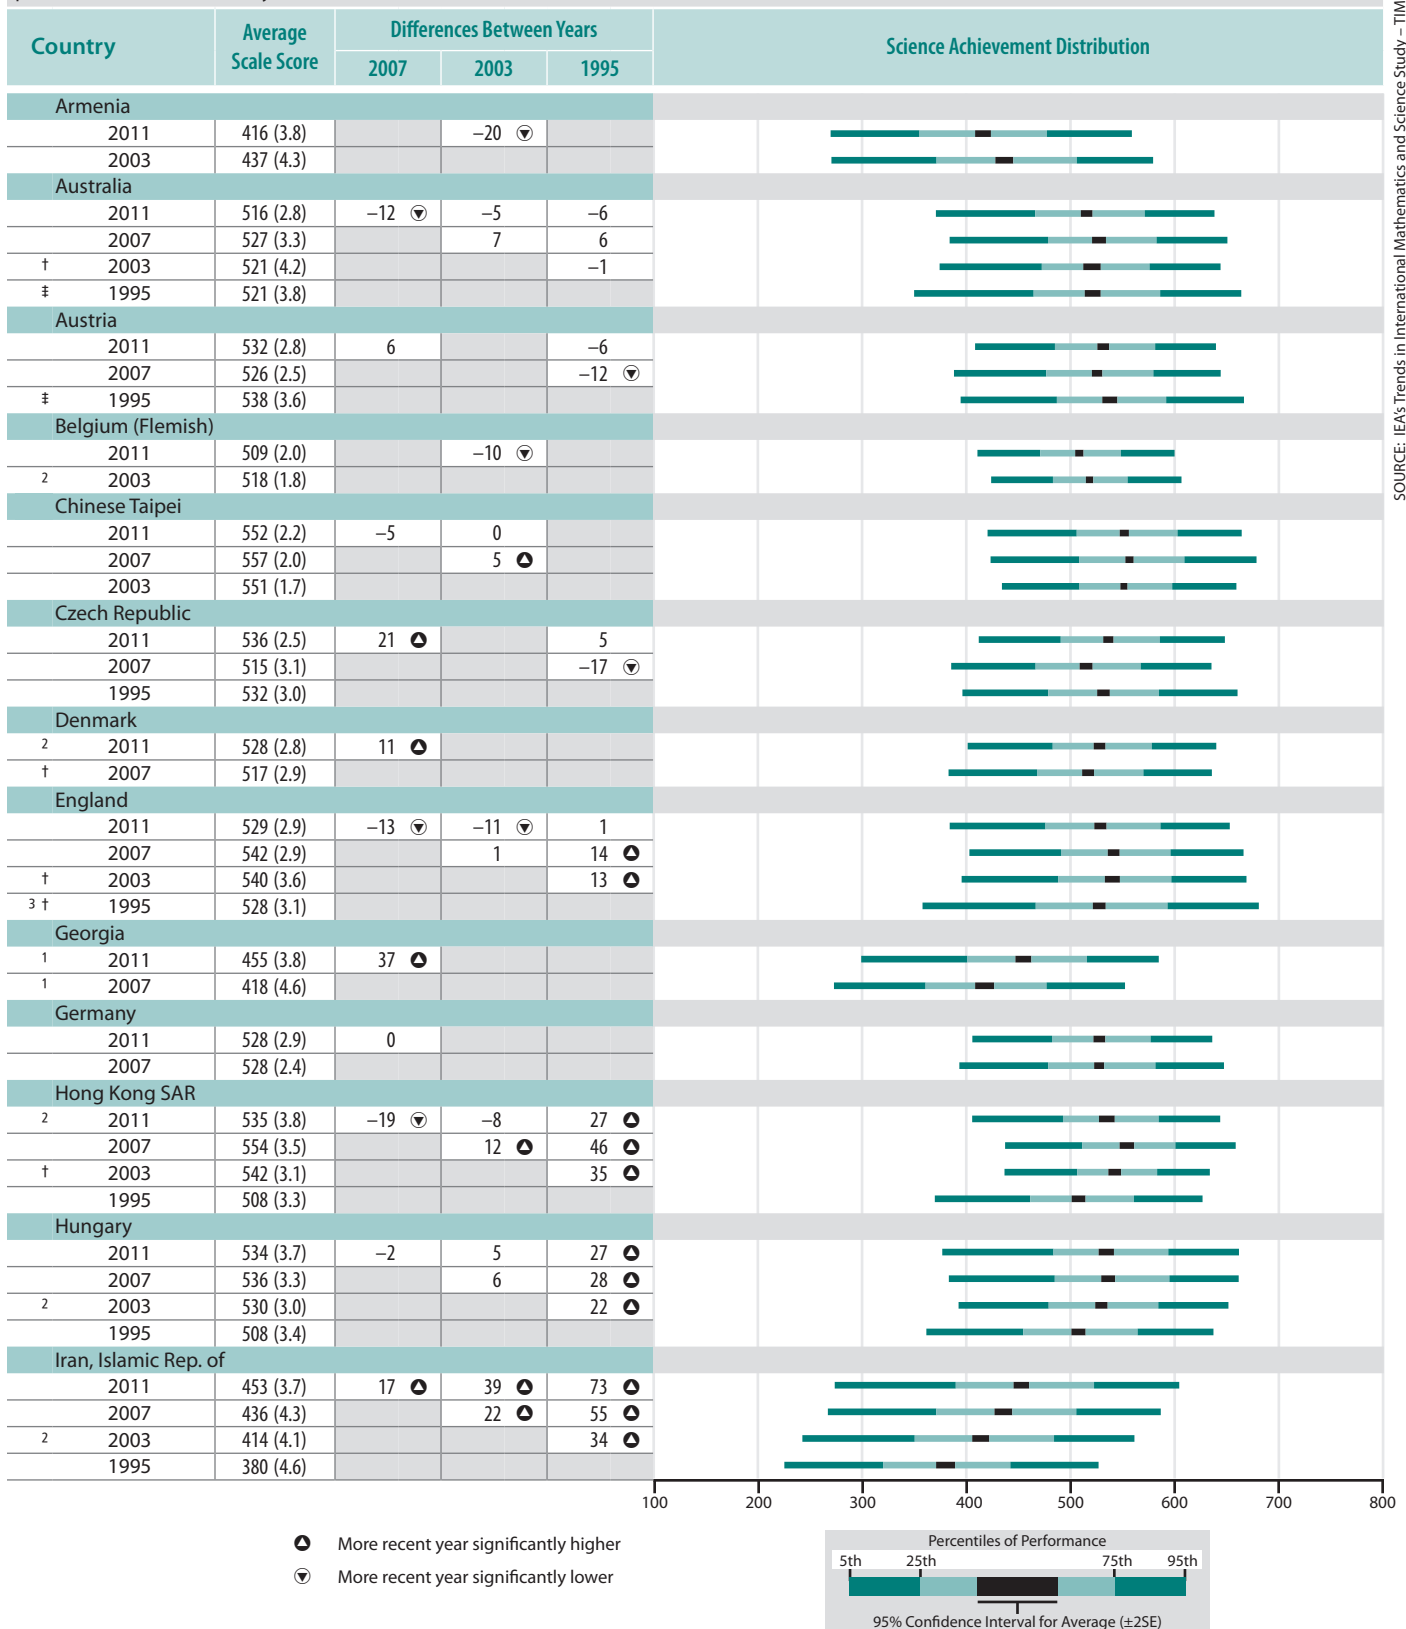

3 TIMSS 1999 did not include a fourth grade assessment.

(or 1999) to 2011 for the 25 countries and eight benchmarking participants that have comparable data from these assessment years.

It is particularly interesting to consider the TIMSS 2011 achievement results in light of the information countries provided in the *TIMSS 2011 Encyclopedia*. Many countries are engaged in implementing important structural, curricular, and instructional reforms and are using the TIMSS results across the assessment years to monitor the impact on achievement of these reforms. Looking at the trends in fourth grade science achievement during the 1995–2011 period, there have been more countries with increases than with decreases. Of the 17 countries and three benchmarking participants with data spanning this period (see Exhibit 1.7), eight countries and one benchmarking participant had increases in average achievement, one country and one benchmarking participant had decreases, and eight countries and one benchmarking participants had no difference. Among the countries with the greatest increase from 1995 to 2011 were Iran, Portugal, Singapore, and Slovenia, with average achievement increases of 56 points or more. Hong Kong SAR and Hungary also both had substantial increases. Among benchmarking participants, Ontario's average achievement increased, while the average achievement decreased in Québec.

Exhibit 1.5: Trends in Science Achievement

Instructions: Read across the row to determine if the performance in the row year is significantly higher (▲) or significantly lower (▼) than the performance in the column year.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

ψ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed 25% but exceeds 15%. Such annotations in exhibits with trend data began in 2011, so data from assessments prior to 2011 are not annotated for reservations.

Benchmarking Participants

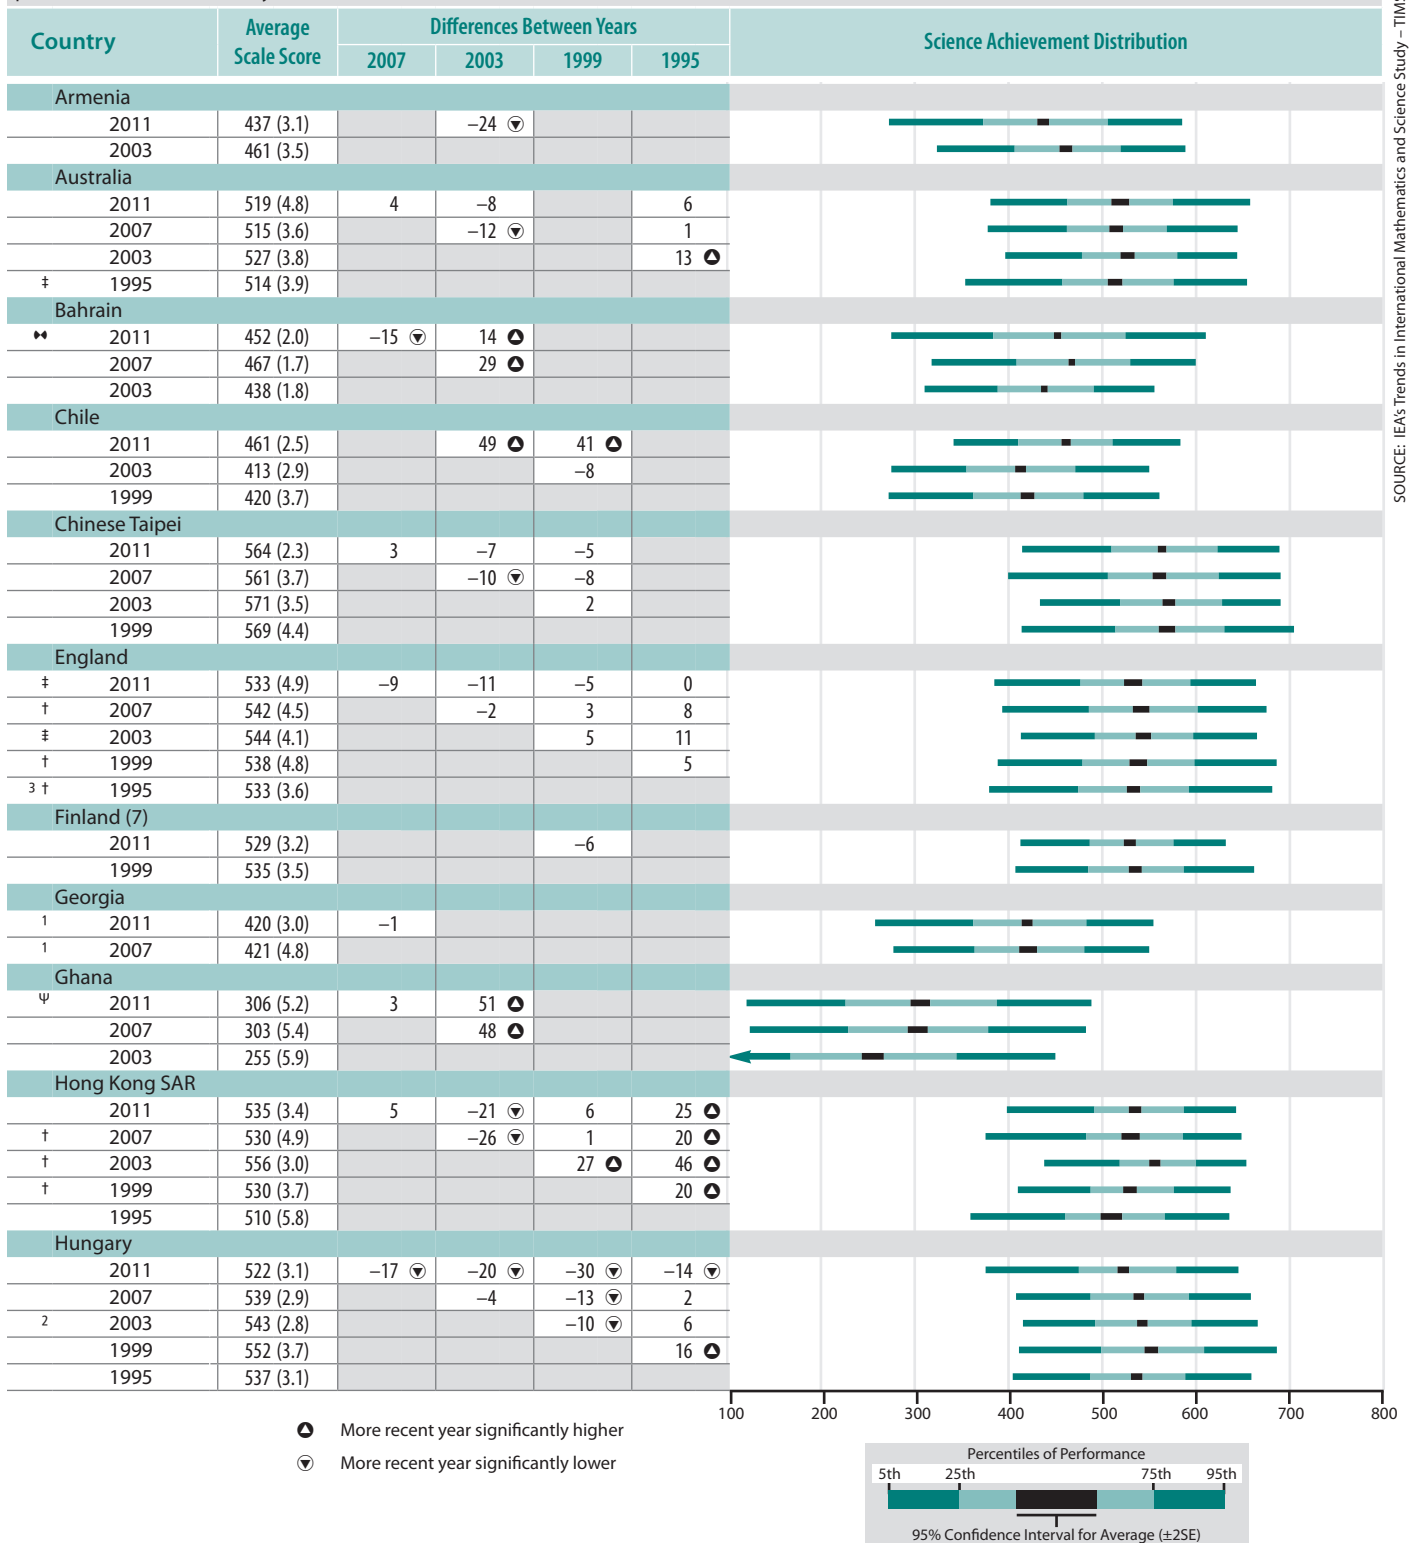

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

At the eighth grade, there was great variability among countries in changes in average science achievement between 1995 or 1999 and 2011, with some countries showing large improvements and others showing large declines. Of the 16 countries and four benchmarking participants with comparable data spanning the 1995 to 2011 period, seven countries and one benchmarking participant showed increases in average achievement, three countries and no benchmarking participants showed decreases, and six countries and three benchmarking participants showed no difference. The countries with the greatest increases in average science achievement between 1995 and 2011 at the eighth grade were Lithuania (50 points), Slovenia (29 points), Hong Kong SAR (25 points), and the Russian Federation (20 points); Ontario also had a similarly large increase during this period (25 points). Countries with the greatest decreases in average achievement between 1995 and 2011 were Sweden (43 points) and Norway (20 points).

For the nine countries and four benchmarking participants that did not participate in TIMSS 1995, but did participate in TIMSS 1999, two countries and two benchmarking participants showed an increase in average achievement from 1999 to 2011: Chile (41 points) and Tunisia (9 points), as well as the states of Massachusetts and North Carolina (34 and 24 points, respectively). Three countries showed a decrease in average achievement over this period, among which Macedonia and Malaysia showed the largest decreases (51 and 66 points, respectively). Four countries and two benchmarking participants showed no difference.

Exhibit 1.6: Trends in Science Achievement

Instructions: Read across the row to determine if the performance in the row year is significantly higher (▲) or significantly lower (▼) than the performance in the column year.

Trends Across Grades: Fourth to Eighth Grade Cohort Analysis

Because TIMSS is conducted on a four-year cycle, the cohort of students that was assessed in the fourth grade in 2007 had reached the eighth grade by 2011, and thus was assessed at the eighth grade in 2011. This enables the 17 countries and three benchmarking participants that assessed both grades in both assessment years to examine how their performance relative to each other changed as the fourth grade students of 2007 became the eighth grade students of 2011. The results are presented in Exhibit 1.9, which shows average science achievement as a difference from the TIMSS scale centerpoint (500) for the fourth grade students in 2007 (upper-left panel) and in 2011 (upper-right panel). The exhibit also shows achievement for the eighth grade students in 2007 (lower-left panel) and in 2011 (lower-right panel). The trends for the fourth and eighth grades (indicated by the gray horizontal arrows), however, were presented more fully in Exhibits 1.5 and 1.6, respectively. The purpose of Exhibit 1.9 is to provide information about relative progress across grades as the cohort of students assessed at the fourth grade in 2007 moved to the eighth grade four years later in 2011. That is, to compare relative performance at the fourth grade in 2007 (upper-left panel) to relative performance at the eighth grade in 2011 (lower-right panel) as indicated by the darker arrow pointing diagonally downward.

Twelve countries—Singapore, Chinese Taipei, Hong Kong SAR, Japan, the Russian Federation, England, the United States, Hungary, Australia, Sweden, Slovenia, and Lithuania—and the Canadian provinces of Ontario and Québec performed above the scale centerpoint at the fourth grade in 2007 and again at the eighth grade in 2011 (although not in the same order of average achievement). Slovenia showed a particularly notable increase, with average achievement moving from 18 points above the centerpoint at the fourth grade in 2007 to 43 points above the centerpoint at the eighth grade in 2011. Norway, Iran, Georgia, Tunisia, and the UAE emirate of Dubai performed below the scale centerpoint in the fourth grade in 2007 and again at the eighth grade in 2011. Italy moved from above the centerpoint in the fourth grade in 2007 to the centerpoint at the eighth grade in 2011.

Gender Differences in Science Achievement

Previous TIMSS assessments have shown gender differences in science achievement to be smaller on average at the fourth grade than at the eighth grade, although the situation varies considerably from country to country.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

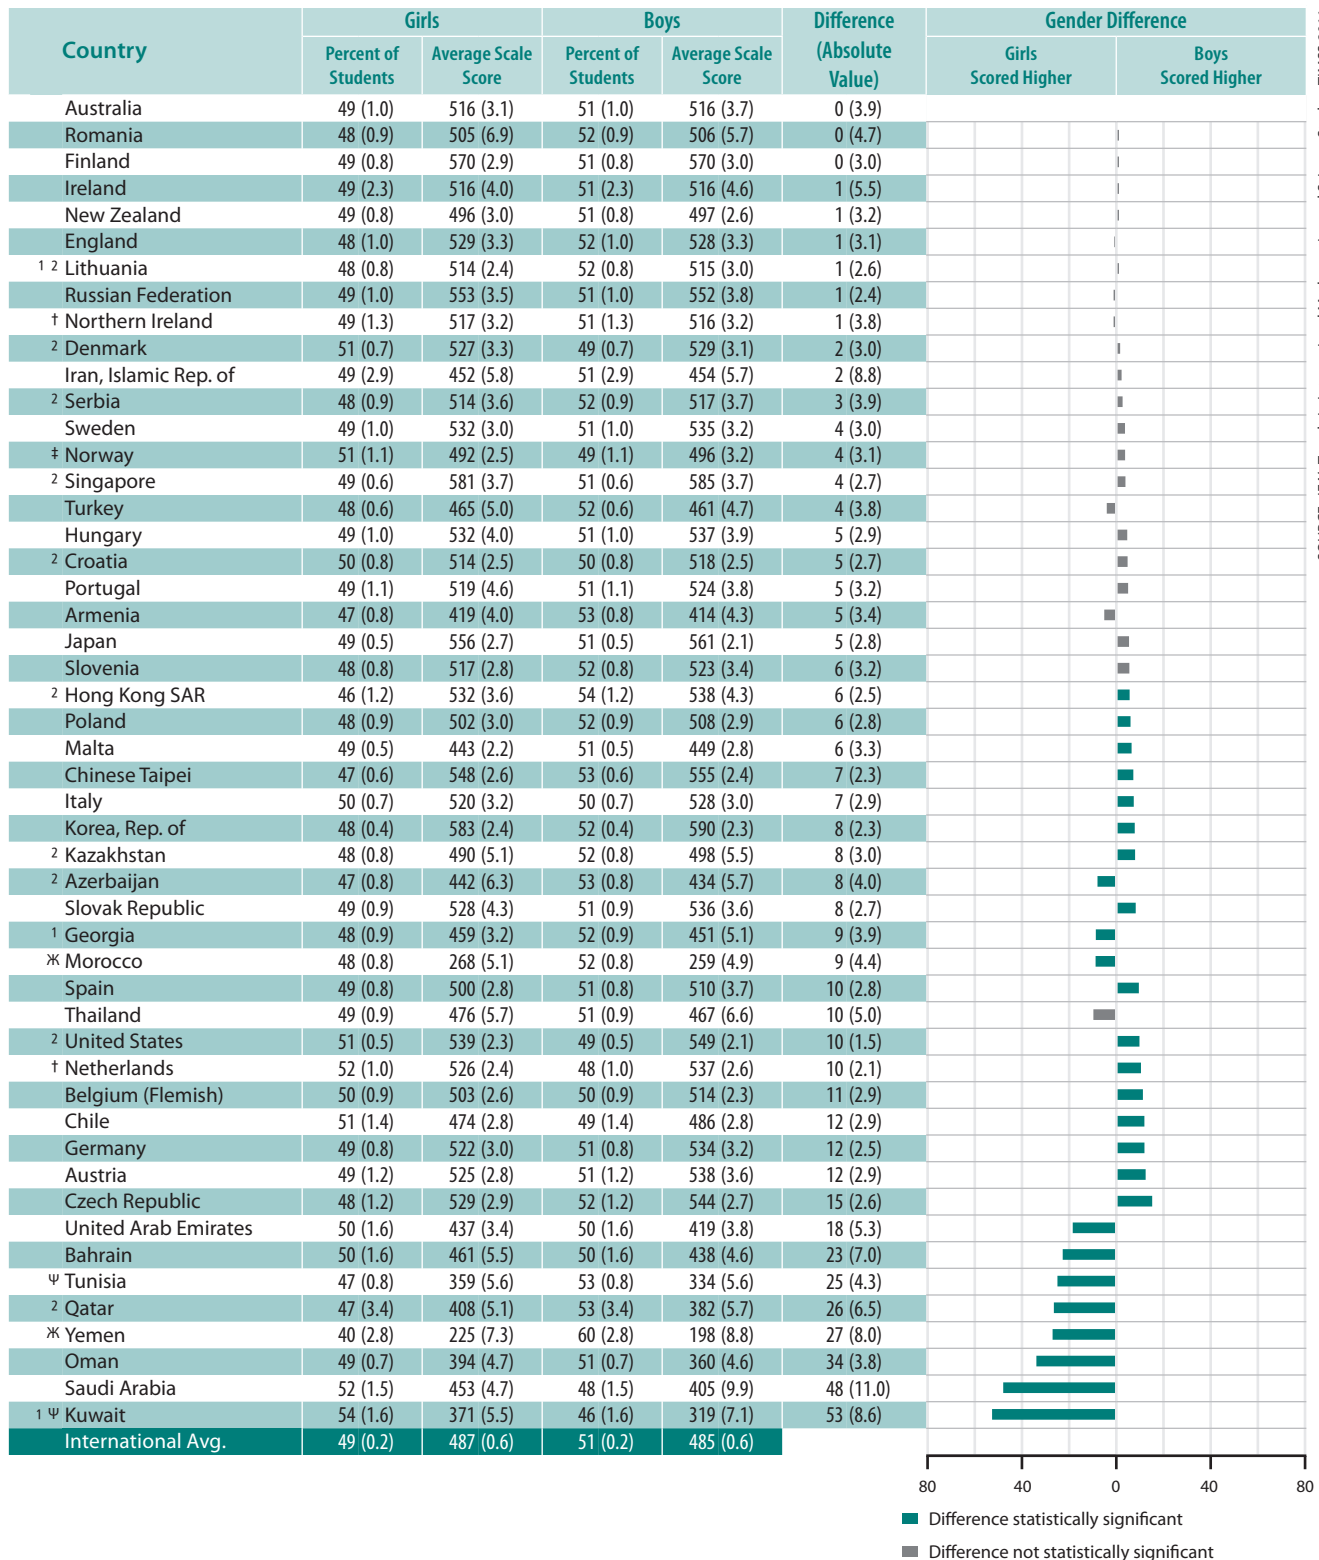

Exhibit 1.10 presents the TIMSS 2011 fourth grade results for gender differences in science achievement. For the TIMSS 2011 countries at the fourth grade, at sixth grade, and the benchmarking participants, it presents girls' average achievement, boys' average achievement, and the difference between the two averages. The bar graph shows the size of the achievement difference between boys and girls and whether that difference is statistically significant (as indicated by a darkened bar). International averages also are shown (averages across the mean scores for girls in each of the countries and the mean scores for boys in each of the countries). Exhibit 1.11 presents corresponding results for the TIMSS 2011 eighth grade assessment.

In each section of Exhibit 1.10, participants are shown in order by the increasing size of the difference between girls and boys in average science achievement. Overall, there was little achievement difference between girls and boys (International Average: 487 vs. 485). Of the 50 countries at the fourth grade, 23 had no significant gender difference in science achievement. Of the 27 remaining countries, 16 had relatively small differences favoring boys, and three had relatively small differences favoring girls. Eight countries had relatively larger differences favoring girls (the United Arab Emirates, Bahrain, Tunisia, Qatar, Yemen, Oman, Saudi Arabia, and Kuwait).

At the sixth grade, there was a significant achievement difference favoring girls in Botswana. Among benchmarking participants, boys had higher average science achievement than girls in Québec, Alberta, Florida, and North Carolina. Girls had higher achievement than boys in Abu Dhabi, UAE.

As shown in Exhibit 1.11, gender differences in science achievement at the eighth grade were larger, on average, than at the fourth grade, with the difference favoring girls (International Average: 480 vs. 474). Similar to the fourth grade, the gender difference varied across countries, with no difference in 17 of the 42 eighth grade countries, a difference favoring boys in ten countries, and a difference favoring girls in the remaining 15 countries. As at the fourth grade, and consistent with findings from TIMSS 2007, the largest achievement differences favoring girls at the eighth grade were in Arabic-speaking countries from the Middle East (the United Arab Emirates, Qatar, Saudi Arabia, the Palestinian National Authority, Jordan, Bahrain, and Oman). Among countries that assessed their ninth grade students, girls had higher science achievement than boys in Botswana and boys had higher achievement than girls in Honduras. Among the 14 benchmarking participants, boys performed better than girls in six US states and the Canadian province of Alberta and girls performed better than boys (by a large margin) in Dubai, UAE.

Trends in Science Achievement by Gender

Exhibits 1.12 and 1.13 show graphic representations across the TIMSS assessments in science achievement of boys and girls for the fourth and eighth grades, respectively. For each country that participated in one or more of the previous TIMSS assessments, these displays show how trends in science achievement have been influenced by differential performance by boys and girls. Because there are many different patterns across countries, the countries are presented in alphabetical order. The scale interval is the same for each country (10 points) to permit comparisons, although the part of scale shown differs according to each country's average achievement. For countries with gender differences in science achievement, the displays reveal progress (or lack thereof) over time toward gender equity.

As described in the previous section, at the fourth grade, there is already gender equity in science achievement in many countries, but there are also countries where overall achievement is less than it might be if both boys and girls performed at the same high level. Countries in which fourth grade girls performed consistently below boys (i.e., in 2011 and on at least two other TIMSS assessments) include Austria, the Czech Republic, the Netherlands, and the United States. In Germany, Italy, and the Slovak Republic, boys had higher average achievement than girls on the two most recent assessments (2007 and 2011); while in Georgia and Tunisia, girls had higher achievement than boys on these two assessments. Armenia, Hungary, Iran, Japan, New Zealand, Norway, and Slovenia had gender differences in earlier assessments but not in TIMSS 2011.

At the eighth grade, with greater gender differences among countries than at the fourth grade, and data from across five TIMSS assessments, trends in science achievement for boys and girls follow a variety of paths. Boys consistently had higher achievement than girls (i.e., in 2011 and in one or more previous assessments) in nine countries: Australia, Chile, Ghana, Hungary, Italy, Japan, the Russian Federation, Tunisia, and the United States. A similar pattern of boys outperforming girls also occurred in four benchmarking participants: the states of Indiana, Minnesota, and North Carolina, and the province of Alberta. Conversely, in eight countries—Armenia, Bahrain, Georgia, Jordan, Macedonia, Oman, the Palestinian National Authority, and Thailand—girls had higher achievement than boys in 2011 and in one or more prior assessments; and twelve countries and four benchmarking participants showed no gender difference in 2011, despite having gender differences on one or more previous assessments. Gender differences in average science achievement followed a different pattern in Lithuania and Malaysia; in these countries, girls outperformed boys in 2011 although boys had outperformed girls in at least one prior assessment.

Chapter 2

Performance at the TIMSS 2011 International Benchmarks

One-third of the Singaporean students reached the fourth grade Advanced International Benchmark, as did 29 percent of students in Korea (median percentage across countries: 5%). At the eighth grade, four East Asian countries had the largest percentages of students reaching this advanced level of performance (18–40%).

Six countries raised achievement across their entire fourth grade student distribution, from low to high performers, and showed improvement across all four international benchmarks over the past decade. At the eighth grade, only three countries showed improvement across all benchmarks, and three had declines.

TIMSS Science Benchmarks:

Advanced International Benchmark 625

High International Benchmark 550

Intermediate International Benchmark 475

Low International Benchmark 400

The TIMSS achievement scale summarizes student performance on test items designed to measure breadth of knowledge in science content domains, as well as a range of cognitive processes within the knowing, applying, and reasoning domains. TIMSS reports achievement at four points along the scale as international benchmarks: Advanced International Benchmark (625), High International Benchmark (550), Intermediate International Benchmark (475), and Low International Benchmark (400).

This chapter presents the science results at the TIMSS 2011 International Benchmarks. To interpret achievement at the benchmarks, the TIMSS & PIRLS International Study Center worked with the TIMSS 2011 Science and Mathematics Item Review Committee (SMIRC) to conduct a detailed scale anchoring analysis to describe science achievement at the benchmarks. The chapter presents those descriptions along with a number of example items and related student performance data to illustrate performance at each of the benchmarks.

TIMSS 2011 Science Framework

The items used in TIMSS 2011 were selected and developed based on the TIMSS 2011 Science Framework contained in the *TIMSS 2011 Assessment Frameworks*. The science assessments at the fourth and eighth grade each were organized around two dimensions: a content dimension specifying the subject matter or content domains to be assessed, and a cognitive dimension specifying the thinking processes that students are likely to use as they engage with the content. As illustrated below, the fourth grade has three content domains: life science, physical science, and earth science. Life science received 45 percent of the assessment emphasis, physical science, 35 percent, and earth science, 20 percent. At the eighth grade, there are four content domains: biology, chemistry, physics, and earth science. Biology received 35 percent of

the assessment emphasis and physics received 25 percent, while chemistry and earth science each received 20 percent. The same three cognitive domains—knowing, applying, and reasoning—were used at both the fourth and eighth grades, although there was a little less emphasis on knowing at eighth grade and somewhat more emphasis on reasoning.

Fourth Grade Content Domains	Eighth Grade Content Domains
45% Life Science	35% Biology
35% Physical Science	20% Chemistry
20% Earth Science	25% Physics
	20% Earth Science
Fourth Grade Cognitive Domains	Eighth Grade Cognitive Domains
40% Knowing	35% Knowing
40% Applying	35% Applying
20% Reasoning	30% Reasoning

● Advanced International Benchmark

625 *Students apply knowledge and understanding of scientific processes and relationships and show some knowledge of the process of scientific inquiry.* Students communicate their understanding of characteristics and life processes of organisms, reproduction and development, ecosystems and organisms' interactions with the environment, and factors relating to human health. They demonstrate understanding of properties of light and relationships among physical properties of materials, apply and communicate their understanding of electricity and energy in practical contexts, and demonstrate an understanding of magnetic and gravitational forces and motion. Students communicate their understanding of the solar system and of Earth's structure, physical characteristics, resources, processes, cycles, and history. They have a beginning ability to interpret results in the context of a simple experiment, reason and draw conclusions from descriptions and diagrams, and evaluate and support an argument.

○ High International Benchmark

550 *Students apply their knowledge and understanding of the sciences to explain phenomena in everyday and abstract contexts.* Students demonstrate some understanding of plant and animal structure, life processes, life cycles, and reproduction. They also demonstrate some understanding of ecosystems and organisms' interactions with their environment, including understanding of human responses to outside conditions and activities. Students demonstrate understanding of some properties of matter, electricity and energy, and magnetic and gravitational forces and motion. They show some knowledge of the solar system, and of Earth's physical characteristics, processes, and resources. Students demonstrate elementary knowledge and skills related to scientific inquiry. They compare, contrast, and make simple inferences, and provide brief descriptive responses combining knowledge of science concepts with information from both everyday and abstract contexts.

● Intermediate International Benchmark

475 *Students have basic knowledge and understanding of practical situations in the sciences.* Students recognize some basic information related to characteristics of living things, their reproduction and life cycles, and their interactions with the environment, and show some understanding of human biology and health. They also show some knowledge of properties of matter and light, electricity and energy, and forces and motion. Students know some basic facts about the solar system and show an initial understanding of Earth's physical characteristics and resources. They demonstrate ability to interpret information in pictorial diagrams and apply factual knowledge to practical situations.

○ Low International Benchmark

400 *Students show some elementary knowledge of life, physical, and earth sciences.* Students demonstrate knowledge of some simple facts related to human health, ecosystems, and the behavioral and physical characteristics of animals. They also demonstrate some basic knowledge of energy and the physical properties of matter. Students interpret simple diagrams, complete simple tables, and provide short written responses to questions requiring factual information.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Fourth Grade Results for the TIMSS 2011 International Benchmarks in Science

Fourth Grade TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.1 summarizes what fourth grade students scoring at the TIMSS International Benchmarks typically know and can do in science. Detailed descriptions of each benchmark level are presented together with example items in subsequent sections of the chapter.

There was substantial variation in performance between students achieving at the Advanced International Benchmark and the Low International Benchmark. At the fourth grade, students at the Advanced International Benchmark applied their knowledge and understanding of scientific processes and relationships across the four content domains, and showed some knowledge of the process of scientific inquiry. They had a beginning ability to interpret results in the context of a simple experiment, reason and draw conclusions from descriptions and diagrams, and evaluate and support an argument. Students at the High International Benchmark applied their knowledge and understanding of the sciences to explain phenomena in everyday and abstract contexts. They demonstrated elementary knowledge and skills related to scientific inquiry, and compared, contrasted, and made simple inferences. At the Intermediate International Benchmark, students had basic knowledge and understanding of practical situations in the sciences, and they demonstrated ability to interpret information in pictorial diagrams and applied factual knowledge to practical situations. Students at the Low International Benchmark had some elementary knowledge of life, physical, and earth sciences, and interpreted simple diagrams, completed simple tables, and provided short written responses to questions requiring factual information.

Fourth Grade Achievement at the TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.2 presents the percentage of students reaching each TIMSS 2011 International Benchmark for countries participating in the fourth grade assessment. The results are presented in descending order based on the percentage of students reaching the Advanced International Benchmark, first for fourth grade countries, followed by sixth grade countries and benchmarking participants on the second page. The percentage of students reaching the Advanced Benchmark is indicated in the bar graph with a black dot. Because students who reached the Advanced Benchmark also reached the other

benchmarks, the percentages illustrated in the graph and shown in the columns to the right are cumulative.

At the fourth grade, the countries with the largest percentages of students reaching the Advanced International Benchmark also were the countries with the highest average science achievement (see Chapter 1). The two countries with the highest achievement—Singapore and Korea—had the largest percentages of students reaching the Advanced International Benchmark. One-third of the Singaporean fourth grade students reached the Advanced Benchmark, as did 29 percent of the Korean students. Twenty percent of the students in Finland reached this level, followed by the Russian Federation (16%), Chinese Taipei (15%), the United States (15%), and Japan (14%).

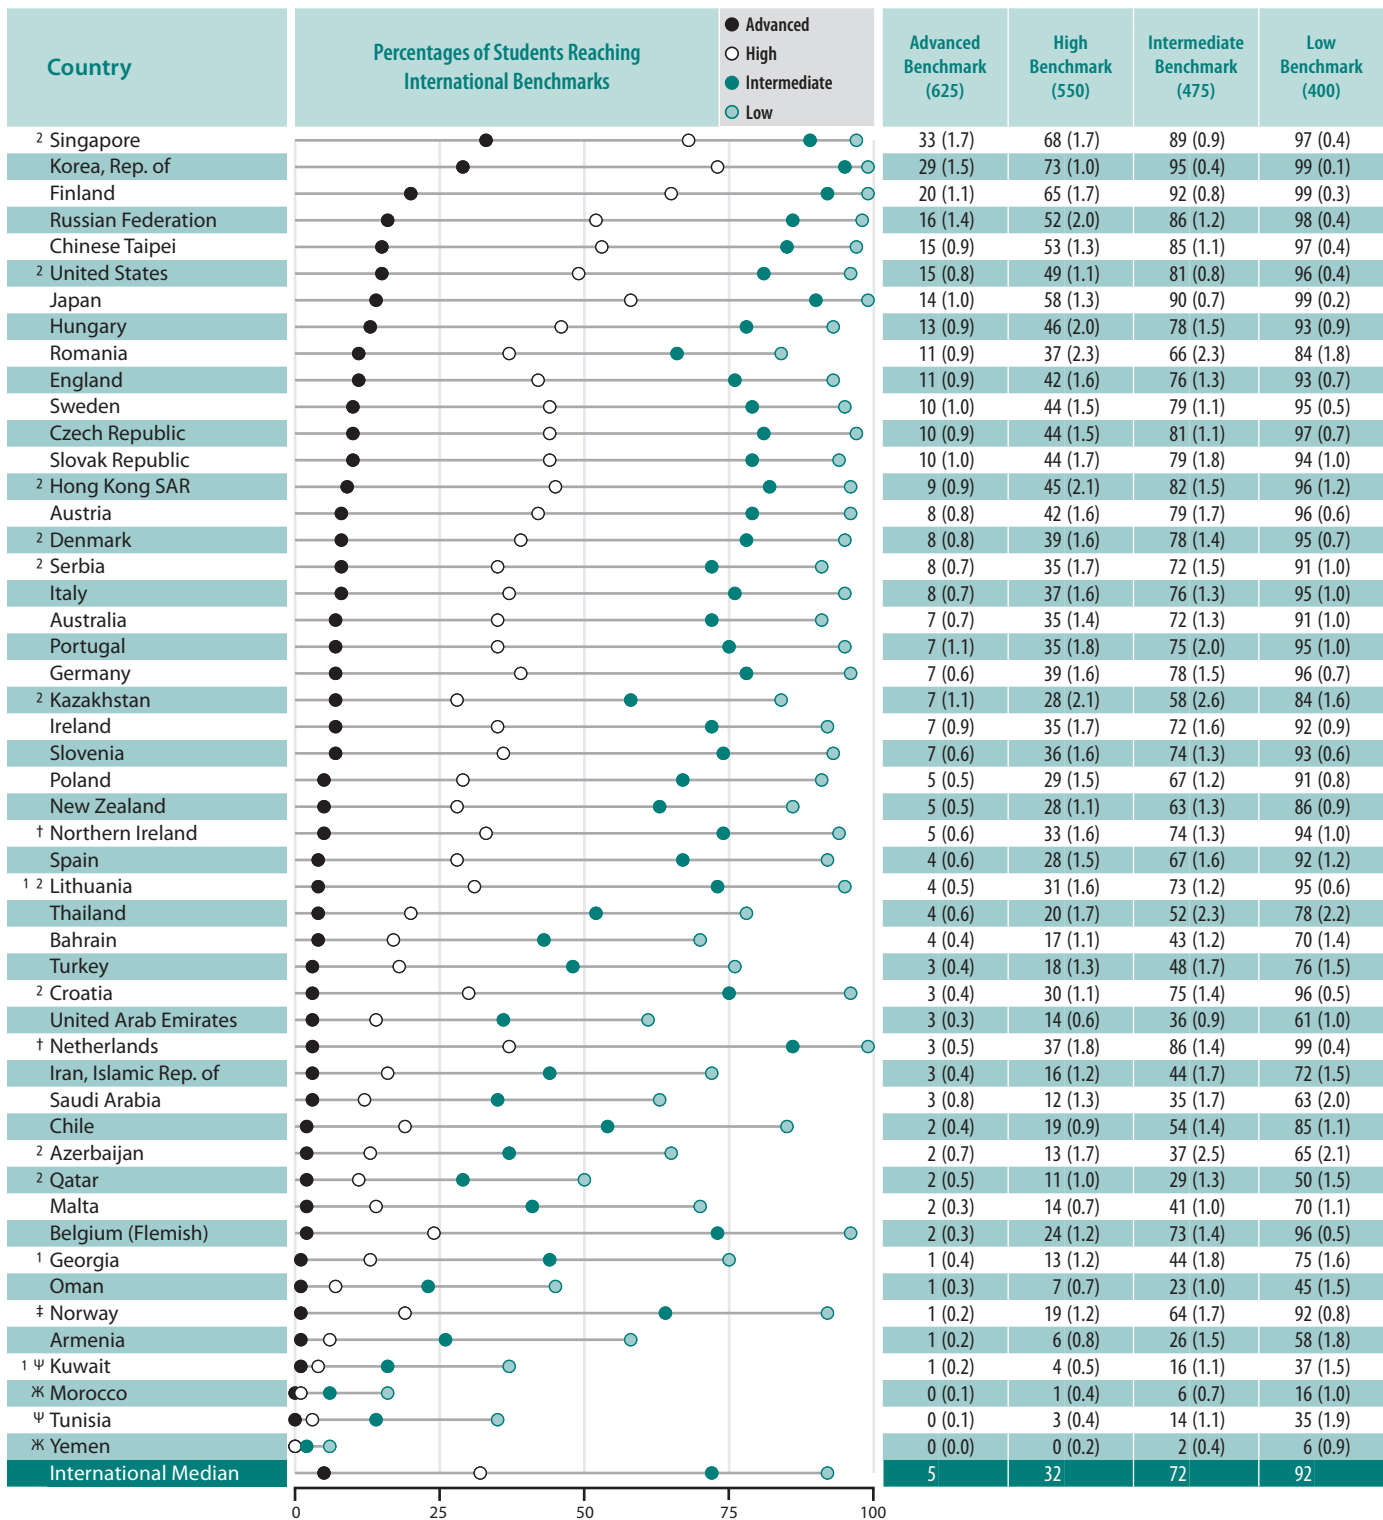

Exhibit 2.2 also provides useful information about the distribution of achievement in each country. For example, even though the Netherlands had many fewer students (3%) reaching the advanced level than did the top-performing countries, the percentages of fourth grade students from the Netherlands reaching the intermediate level (86%) and low level (99%) were comparable to the percentages reaching these levels among the highest-performing countries.

As a point of reference, Exhibit 2.2 provides the median for each of the benchmarks at the bottom of each of the four right hand columns. By definition, half of the countries will have a percentage in the column above the median and half will be below the median. The median percentages of students reaching the International Benchmarks were as follows: Advanced–5 percent, High–32 percent, Intermediate–72 percent, and Low–92 percent. The high median percentage of students reaching the low level indicates that many countries are able to educate almost all of their fourth grade students to a basic level of science achievement.

Fourth Grade Trends in Performance at the TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.3 shows the changes in percentages of fourth grade students reaching the four benchmarks for countries and benchmarking participants that also participated in TIMSS 1995, 2003, and/or 2007. An up arrow indicates that the percentage of students reaching a benchmark is higher in 2011 than in the past cycle, and a down arrow indicates that the percentage is lower in 2011. The patterns in this exhibit generally mirror the trends in average achievement discussed in Chapter 1, and can provide further information about countries' improvement or decline over time.

Exhibit 2.2: Performance at the International Benchmarks of Science Achievement

✱ Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds 25%.

Ψ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed 25% but exceeds 15%.

See Appendix C.2 for target population coverage notes 1, 2, and 3. See Appendix C.8 for sampling guidelines and sampling participation notes †, ‡, and §.

▲ 2011 percent significantly higher

▼ 2011 percent significantly lower

In general, there were more improvements across the International Benchmarks in 2011 than there were declines. Six countries have improved since 1995 at all four benchmarks: Singapore, Korea (with a ceiling effect at the Low Benchmark), Hong Kong SAR, Portugal, Slovenia, and Iran. Since 1995, Japan had gains at all except the Advanced Benchmark, and Hungary had gains at all except the Low Benchmark. The United States, the Czech Republic, and the Canadian province of Ontario improved at the two lower benchmarks, although the United States also showed a decline in the percentage of students reaching the Advanced Benchmark since 1995.

No countries or benchmarking participants showed declines in the percentages of students at the intermediate or low levels since 1995. However, in addition to the United States, six other countries showed declines at the advanced level (England, Austria, Australia, New Zealand, the Netherlands, and Norway), and three of these also showed declines at the high level (Australia, New Zealand, and Norway).

Fourth Grade TIMSS 2011 Low International Benchmark

Exhibit 2.4 presents the detailed description of student achievement at the Low International Benchmark. At this benchmark, students had some elementary knowledge of life, physical, and earth sciences, and interpreted simple diagrams, completed simple tables, and provided short written responses to questions requiring factual information.

As specified in the TIMSS 2011 Science Framework, almost half of the fourth grade assessment (45%) was devoted to items in the life science domain. Several items answered correctly by students achieving at the lower scale levels assessed knowledge of characteristics and life processes of living things, one of the topics in the TIMSS Framework. Exhibit 2.5 presents Example Item 1, a question requiring students to apply elementary knowledge about the physical characteristics of animals and illustrating performance at the Low International Benchmark. With an international average of 83 percent correct across the fourth grade countries, this item was relatively easy for students in most countries.

Exhibit 2.6 presents Example Item 2, in which students must interpret a simple diagram and recognize that an iron nail completes an electric circuit. This elementary knowledge of physical science exemplifies the Low International Benchmark, where students demonstrated some basic knowledge of physical properties of matter. The international average was 71 percent correct, and this item was relatively easy for students in many countries.

● **Low International Benchmark**

400

Summary

Students show some elementary knowledge of life, physical, and earth sciences. Students demonstrate knowledge of some simple facts related to human health, ecosystems, and the behavioral and physical characteristics of animals. They also demonstrate some basic knowledge of energy and the physical properties of matter. Students interpret simple diagrams, complete simple tables, and provide short written responses to questions requiring factual information.

In life science, students demonstrate knowledge of some simple facts related to human health. For example, they state one effect the Sun can have on unprotected skin and name one thing humans can do to maintain good physical health. They also demonstrate some knowledge of behavioral and physical characteristics of animals. Students recognize that fat layers help keep some animals warm, that wings are common to birds, bats, and butterflies, and that birds sit on their eggs to keep them warm. Students exhibit an elementary understanding of ecosystems. They recognize a predator in a list of animals and match animals to their ecosystems.

In physical science, students demonstrate some basic knowledge of energy and the physical properties of matter. For example, they recognize that an iron nail can complete an electrical circuit and allow a light bulb to glow, and they identify wind as the cause of movement in a sail boat. Students recognize that the vibrations that produce sound in a guitar start with the strings and, from a diagram, recognize which of a set of thermometer readings shows the hottest water.

In earth science, students identify one way people use air and they identify a planet other than Earth that orbits the Sun.

Students interpret simple diagrams, complete simple tables, and provide short written responses to questions requiring factual information.

Fourth Grade TIMSS 2011 Intermediate International Benchmark

Exhibit 2.7 provides the detailed description of student achievement at the Intermediate International Benchmark. At this level, students had basic knowledge and understanding of practical situations in the sciences, and they demonstrated ability to interpret information in pictorial diagrams and apply factual knowledge to practical situations. The majority of students in most countries reached this benchmark.

As mentioned in discussing performance at the low level (Example Item 1), characteristics and life processes of living things was a topic in the TIMSS Science Framework. Example Item 3 in Exhibit 2.8 is a slightly more difficult life science item that requires students to pair three animals with their distinguishing biological characteristics. In TIMSS 2011, some of the constructed response items were worth 1 point and some 2 points, and the illustrative answers provided with the example items always show an answer that received full credit. The number of possible points for each constructed response item is indicated across the bottom of the exhibit. In this item, students who correctly identified the monkey, grasshopper, and octopus received the maximum score of 1 point. The international average percent correct was 58 percent, with a considerable range in performance across countries. In Korea, Singapore, and Hungary, the percent correct was 80 percent or more, compared to 16 percent or less in Morocco and Yemen.

Exhibit 2.9 presents Example Item 4, a constructed response item from the domain of earth science exemplifying the basic, practical knowledge that characterizes student performance at the Intermediate Benchmark. Students answering this item correctly stated one form of energy the Earth receives from the sun. On average, across fourth grade countries, 54 percent of students answered correctly.

● Intermediate International Benchmark

475

Summary

Students have basic knowledge and understanding of practical situations in the sciences. Students recognize some basic information related to characteristics of living things, their reproduction and life cycles, and their interactions with the environment, and show some understanding of human biology and health. They also show some knowledge of properties of matter and light, electricity and energy, and forces and motion. Students know some basic facts about the solar system and show an initial understanding of Earth's physical characteristics and resources. They demonstrate ability to interpret information in pictorial diagrams and apply factual knowledge to practical situations.

In life science, students demonstrate some knowledge of the characteristics of living things. For example, students can identify a characteristic that all living things share. From pictures of animals, students pair each animal with its distinguishing biological characteristics (skeleton, milk production, number of legs). Students also recognize the stomach as an organ where digestion takes place. Students demonstrate knowledge of the interactions of living things with their environments as well as the impacts humans can have on their environment. They can complete a food chain and distinguish between human activities that have positive or negative effects on the environment. Students show some understanding of the reproduction and life cycles of organisms. They recognize that for mammals, a male and a female are needed to reproduce. Students also know that tadpoles hatch from frogs' eggs and the function of seeds. Students demonstrate knowledge of some basic facts related to human biology and health. They recognize that the body needs more oxygen during exercise. Students recognize common preventative health measures, including how people can protect their teeth from decay and the benefit of hand washing. They also recognize how influenza is transmitted.

In physical science, students show knowledge about some properties of matter and light. For example, from a list of common materials, students indicate which of them will burn; recognize the order of ice, liquid water, and steam from coldest to hottest; and recognize that salt water is a mixture. Students also recognize that an image of the sun in a lake results from sunlight reflecting off of water. Students show knowledge about some facts of electricity and energy and apply their knowledge to practical situations. Students identify electricity as the energy source for household objects. They recognize that a metal object can complete an electric circuit (e.g., in a flashlight) or could be the unknown, hidden component in a complete electric circuit. Students show and apply introductory knowledge of forces and motion. They state a reason why two objects of identical size and shape can travel different distances after a push and, from a diagram, they identify the direction of the force of Earth's gravity.

In earth science, students show an initial understanding of Earth's physical characteristics and resources. For example, they provide evidence for the existence of air by considering an inflated balloon, match a list of landscape features to their descriptions, and describe one thing people can do to avoid wasting water. In addition, students know some basic facts about the solar system. They can state one form of energy Earth receives from the Sun and state two planets other than Earth that orbit the Sun.

Students interpret information in pictorial diagrams, apply factual knowledge to everyday situations, and provide simple explanations for biological and physical phenomena.

Description: Pairs pictures of three animals with their distinguishing biological characteristics (skeleton, milk production, number of legs)

Monkey

Crocodile

Grasshopper

Octopus

Answer the following questions using the animals shown above. Write the name for the correct animal in the spaces below.

Which animal has an internal skeleton and produces milk for its young?

monkey

Which animal has an external skeleton and three pairs of legs?

grasshopper

Which animal has a soft body and no skeleton?

octopus

The answer shown illustrates the type of student response that was given 1 of 1 points.

Fourth Grade TIMSS 2011 High International Benchmark

Exhibit 2.10 presents the description of achievement at the High International Benchmark. Students at this level have extended the breadth of their knowledge in the science content domains and applied their knowledge and understanding to explain phenomena in everyday and abstract contexts. They also demonstrated elementary knowledge and skills related to scientific inquiry, and compared, contrasted, and made simple inferences.

Exhibit 2.11 presents Example Item 5, which requires students to reason through a problem situation and justify their reasoning based on their knowledge of physical phenomena. This constructed response item exemplifies the type of brief descriptive response students scoring at the High Benchmark provided, using their knowledge of a science concept applied to an everyday context. On average internationally, 42 percent of students received full credit for this item, with a very wide range across countries (0–74%).

○ **High International Benchmark**

550

Summary

Students apply their knowledge and understanding of the sciences to explain phenomena in everyday and abstract contexts. Students demonstrate some understanding of plant and animal structure, life processes, life cycles, and reproduction. They also demonstrate some understanding of ecosystems and organisms' interactions with their environment, including understanding of human responses to outside conditions and activities. Students demonstrate understanding of some properties of matter, electricity and energy, and magnetic and gravitational forces and motion. They show some knowledge of the solar system, and of Earth's physical characteristics, processes, and resources. Students demonstrate elementary knowledge and skills related to scientific inquiry. They compare, contrast, and make simple inferences, and provide brief descriptive responses combining knowledge of science concepts with information from both everyday and abstract contexts.

In life science, students demonstrate an understanding of plant and animal structure and life processes. For example, they have some knowledge of the parts and functions of a flowering plant and can distinguish living from nonliving things and animals with backbones from those without backbones. Students demonstrate some understanding of reproduction and life cycles of organisms. They know that if the only remaining members of a species of mammal are female, they will not be able to reproduce, and can distinguish inherited from non-inherited features. Students demonstrate an understanding of ecosystems and can reason about organisms' interactions with their environment. They can identify a predator-prey relationship and human activities which have positive or negative effects on the environment. Students also understand that plants make food using energy from the Sun and recognize some plant and animal features that provide advantages in a given environment (the shape of leaves, animal coloration). Students demonstrate understanding of human responses to outside conditions and activities. They recognize the effect of light on pupil size and changes in the body during exercise.

In physical science, students demonstrate basic understanding of some properties of matter. For example, students can justify that objects with more volume do not necessarily weigh more. They explain that heat transferred through metal reaches a point that is closer to the heat source in a shorter time. They connect the color change and surface roughening of a metal object to the process of rusting, and also, in the context of an investigation, explain that solids (e.g., candy) dissolve faster in hot water than in cold water. Students also show a basic understanding of the properties of shadows. They recognize what causes a shadow to be formed and deduce the direction it is cast. Students show knowledge of electricity and energy and apply their knowledge to practical situations. Given a list of everyday objects, they identify which ones conduct electricity and which do not and they identify sources of energy and specify which can be used to produce electricity. Students apply some knowledge to and reason about gravitational and magnetic forces and motion. They recognize that gravity causes an object to fall to the ground, recognize that two metal bars that repel each other must be magnets, and identify the orientation of the poles of repelling magnets.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

○ **High International Benchmark**

550

In earth science, students demonstrate a basic understanding of Earth's physical characteristics and resources. For example, they recognize that when water disappears from a surface, it goes into the air. They can, from a table showing location, temperature, and cloud cover, identify the place where it is most likely to snow. In addition, they can describe one advantage of farming near a river. Students have an understanding of some of Earth's processes, history, and cycles. They recognize that water flows from mountains to oceans via rivers, and that fossils are the best evidence that there were many kinds of animals on Earth that no longer exist today. They also recognize that an observation of low clouds can lead to a conclusion about their composition. Students show some knowledge of the solar system. They recognize that the solar system is made up of the Sun and its planets, identify the Earth, Moon, and Sun in a diagram showing their relative positions and orbits, and recognize that the moon's shape looks different at different times of the month.

Students demonstrate elementary knowledge and skills related to scientific inquiry. For example, from a table showing the results of an experiment, they can identify what was being studied in the experiment. Furthermore, they compare, contrast, and make simple inferences, and provide brief descriptive responses combining knowledge of science concepts with information from both everyday and abstract contexts.

Content Domain: Physical Science

Cognitive Domain: Reasoning

Description: Justifies that objects with more volume do not necessarily weigh more using a diagram of three objects of different materials ordered by volume

Jack's teacher places three objects on a table, as shown below. She puts them in order according to their volume.

Jack thinks that objects with more volume weigh more.

Do you agree with him?

(Check one box.)

☐ Yes

☒ No

Explain your answer.

It depends on what the object is made of. The brick is smaller than the styrofoam block but it is more dense so it probably weighs more.

The answer shown illustrates the type of student response that was given 1 of 1 points.

According to the TIMSS 2011 Science Framework, fourth grade students are expected to demonstrate some understanding about Earth's place in the solar system. Exhibit 2.12 presents Example Item 6, which exemplifies the type of earth science knowledge exhibited by fourth grade students at the High Benchmark. Students are asked to identify the Earth, Moon, and Sun from a diagram of their orbits. Internationally, on average, 49 percent of the students answered this item correctly.

Fourth Grade TIMSS 2011 Advanced International Benchmark

Exhibit 2.13, on the following page, describes fourth grade performance at the Advanced International Benchmark. At this benchmark, students applied their knowledge and understanding of scientific processes and relationships across the four content domains, and showed some knowledge of the process of scientific inquiry. They had a beginning ability to interpret results in the context of a simple experiment, reason and draw conclusions from descriptions and diagrams, and evaluate and support an argument.

Example Item 7 in Exhibit 2.14 shows an example of the type of item in the life sciences that fourth grade students at the Advanced International Benchmark could answer correctly. This constructed response item required students to identify four major plant structures in a diagram and describe the function of most of the structures. On average across countries, only 21 percent of the students gained full credit on this item, which was relatively difficult for students in most countries. Eighty percent of students in Singapore gained full credit, but in no other country did more than 42 percent of students answer fully correctly.

In physical science at the Advanced Benchmark level, students demonstrated an understanding of magnetic forces and reasoned to form conclusions about them. Example Item 8 in Exhibit 2.15 is a constructed response item which required students to apply their knowledge of magnetic properties to a set of observations, reason and draw conclusions based on the observations, and provide support for their reasoning. On average internationally, this item also was relatively difficult, with 26 percent of students providing a response that received full credit.

● Advanced International Benchmark

625

Summary

Students apply knowledge and understanding of scientific processes and relationships and show some knowledge of the process of scientific inquiry. Students communicate their understanding of characteristics and life processes of organisms, reproduction and development, ecosystems and organisms' interactions with the environment, and factors relating to human health. They demonstrate understanding of properties of light and relationships among physical properties of materials, apply and communicate their understanding of electricity and energy in practical contexts, and demonstrate an understanding of magnetic and gravitational forces and motion. Students communicate their understanding of the solar system and of Earth's structure, physical characteristics, resources, processes, cycles, and history. They have a beginning ability to interpret results in the context of a simple experiment, reason and draw conclusions from descriptions and diagrams, and evaluate and support an argument.

In life science, students show knowledge of characteristics and life processes of a variety of organisms. For example, students identify the body covering that protects a reptile, recognize that muscles move bones, and they know the major parts of a flowering plant and can state their functions. Students show some understanding of reproduction and development of organisms. They recognize, from a list of animals, that the young form of humans looks most like the adult form, recognize examples of animals that take care of their young, and they describe how pollen is spread. Students communicate understanding of relationships in ecosystems and understand how organisms interact with their environment. They describe one physical change that takes place in a mammal as the weather gets cold, how migration increases the survival of birds, and a feature that helps a cactus survive in the desert. They also describe human activities that can lead to the extinction of animals. Students communicate understanding of factors related to human health. They state that calcium is needed for bone growth, explain why people should drink liquids frequently, and that sneezing transmits germs even when a person does not appear to be sick.

In physical science, students show understanding of the relationships among physical properties of materials and of the basic properties of light. For example, students can identify an unknown material as a gas based on its behavior in a closed container and they justify their answer. Given two groups of everyday objects, students recognize which property was used to classify them. In the context of an investigation, students explain what makes a solid dissolve faster in water and what makes a solution more dilute. They recognize that burning results in new substances and that light is made up of different colors. Students apply and communicate their understanding and reason about electricity and energy in practical contexts. They explain that a bulb will not light in an incomplete electrical circuit. They also recognize that heat needs to be supplied for melting and boiling, but not for freezing, and explain how a sweater can keep a bottle of water cold. Students demonstrate an understanding of magnetic and gravitational forces and motion and reason to form conclusions about them. They infer that magnets have different strengths from a diagram of magnets attracting pins from two different distances. Also, based on a series of diagrams providing pairwise information about the weights of cubes, they draw a conclusion about their relative weights. They reason, using diagrams, where children of the same and different weights should sit to balance a seesaw.

● **Advanced International Benchmark**

625

In earth science, students communicate their understanding of Earth's structure, physical characteristics, resources, processes, cycles, and history. For example, they state two things that make up the Earth's crust and recognize that water covers most of Earth's surface. They describe one disadvantage of farming near a river and recognize that soil rich in decaying matter helps plants grow and that soils can change naturally over time. They also recognize how fish fossils are formed. Students demonstrate an understanding of the Earth in the context of the solar system. They recognize how long it takes for the Earth to orbit the Sun and rotate on its axis as well as describe how that rotation causes day and night. They also explain why the size and shape of a shadow appears different at different times of the day.

Students demonstrate some ability to recognize how a simple experiment should be set up. They have an elementary ability to interpret results, reason and draw conclusions from descriptions and diagrams, and evaluate and support an argument.

Description: From a diagram of a flowering plant, identifies numbered parts and states a function of most of these parts

The diagram shows a flowering plant. Four of its parts are numbered.

In the table below, write the name of each part, and state its function.

Part Number	Name of Part	Function of Part
1	flower	produces seeds
2	stem	transports water and food
3	leaf	makes food for the plant
4	root	absorbs water, minerals, and nutrients into the plant

The answer shown illustrates the type of student response that was given 2 of 2 points.

Description: Infers that magnets have different strengths from an observation of magnets attracting pins from two different distances

Betty has two magnets (A and B) and two metal pins that are the same.

She slides Magnet A along a table until a pin is attracted to the magnet.

She slides Magnet B along a table until a pin is attracted to the magnet.

She finds that Magnet A attracts the pin from 15cm and Magnet B attracts the pin from 10cm.

Steven says that both magnets are equally strong.

Do you agree?

(Check one box.)

☐ Yes

☒ No

Explain your answer.

magnet A is stronger because it attracted the pin from farther away than magnet B did.

The answer shown illustrates the type of student response that was given 1 of 1 points.

Exhibit 2.16 presents Example Item 9, which exemplifies the knowledge of processes in earth science that is typical of students at the Advanced International Benchmark. On average, 39 percent of students internationally answered this item correctly, recognizing the soil change due to natural causes. As with most example items, there was wide variation across countries in the percentage of students correctly answering the item, in this case ranging from 19 percent to 63 percent.

Eighth Grade Results for the TIMSS 2011 International Benchmarks in Science

Eighth Grade TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.17 summarizes what eighth grade students scoring at the TIMSS International Benchmarks typically know and can do in science. Detailed descriptions of each benchmark level are presented along with example items in subsequent sections of the chapter. Similar to the fourth grade, at the eighth grade there was also a considerable difference in performance between students achieving at the Advanced International Benchmark and students at the Low International Benchmark.

Students performing at the Advanced International Benchmark communicated an understanding of complex and abstract concepts in biology, chemistry, physics, and earth science. They also combined information from several sources to solve problems and draw conclusions, and provided written explanations to communicate scientific knowledge. Students at the High International Benchmark demonstrated understanding of concepts related to science cycles, systems, and principles. They also demonstrated some scientific inquiry skills, and combined and interpreted information from various types of diagrams, contour maps, graphs, and tables; selected relevant information, analyzed, and drew conclusions; and provided short explanations conveying scientific knowledge. At the Intermediate International Benchmark, students recognized and applied their understanding of basic scientific knowledge in various contexts. They interpreted information from tables, graphs, and pictorial diagrams, drew conclusions, and communicated their understanding through brief descriptive responses. Students at the Low International Benchmark recognized some basic facts from the life and physical sciences, as well as interpreted simple pictorial diagrams, completed simple tables, and applied their basic knowledge to practical situations.

● Advanced International Benchmark

- 625** *Students communicate an understanding of complex and abstract concepts in biology, chemistry, physics, and earth science. Students demonstrate some conceptual knowledge about cells and the characteristics, classification, and life processes of organisms. They communicate an understanding of the complexity of ecosystems and adaptations of organisms, and apply an understanding of life cycles and heredity. Students also communicate an understanding of the structure of matter and physical and chemical properties and changes and apply knowledge of forces, pressure, motion, sound, and light. They reason about electrical circuits and properties of magnets. Students apply knowledge and communicate understanding of the solar system and Earth's processes, structures, and physical features. They understand basic features of scientific investigation. They also combine information from several sources to solve problems and draw conclusions, and they provide written explanations to communicate scientific knowledge.*

○ High International Benchmark

- 550** *Students demonstrate understanding of concepts related to science cycles, systems, and principles. They demonstrate understanding of aspects of human biology, and of the characteristics, classification, and life processes of organisms. Students communicate understanding of processes and relationships in ecosystems. They show an understanding of the classification and compositions of matter and chemical and physical properties and changes. They apply knowledge to situations related to light and sound and demonstrate basic knowledge of heat and temperature, forces and motion, and electrical circuits and magnets. Students demonstrate an understanding of the solar system and of Earth's processes, physical features, and resources. They demonstrate some scientific inquiry skills. They also combine and interpret information from various types of diagrams, contour maps, graphs, and tables; select relevant information, analyze, and draw conclusions; and provide short explanations conveying scientific knowledge.*

● Intermediate International Benchmark

- 475** *Students recognize and apply their understanding of basic scientific knowledge in various contexts. Students apply knowledge and communicate an understanding of human health, life cycles, adaptation, and heredity, and analyze information about ecosystems. They have some knowledge of chemistry in everyday life and elementary knowledge of properties of solutions and the concept of concentration. They are acquainted with some aspects of force, motion, and energy. They demonstrate an understanding of Earth's processes and physical features, including the water cycle and atmosphere. Students interpret information from tables, graphs, and pictorial diagrams and draw conclusions. They apply knowledge to practical situations and communicate their understanding through brief descriptive responses.*

○ Low International Benchmark

- 400** *Students can recognize some basic facts from the life and physical sciences. They have some knowledge of biology, and demonstrate some familiarity with physical phenomena. Students interpret simple pictorial diagrams, complete simple tables, and apply basic knowledge to practical situations.*

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Eighth Grade Achievement at the TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.18 presents the percentage of students reaching each TIMSS 2011 International Benchmark. The results are presented in descending order based on the percentage of students reaching the Advanced International Benchmark, first for countries that tested eighth grade students, and then for ninth grade countries and benchmarking participants on the second page. The percentage of students reaching the Advanced Benchmark is indicated in the bar graph with a black dot. Because students who reached the Advanced Benchmark also reached the other benchmarks, the percentages illustrated in the graph and shown in the columns to the right are cumulative.

At the eighth grade, four East Asian countries had the largest percentages of students reaching the Advanced International Benchmark. Singapore had 40 percent of their students reach this benchmark, followed by Chinese Taipei (24%), Korea (20%), and Japan (18%). Next, the Russian Federation and England had 14 percent of their students reaching the Advanced Benchmark; Slovenia and Finland had 13 percent of their students reaching this level. Several of the US benchmarking states also had similarly high percentages of students at the Advanced Benchmark, including Massachusetts (24%), Minnesota (16%), Colorado (14%), Connecticut (14%), and Florida (13%).

Exhibit 2.18 also provides useful information about the distribution of achievement in each country. For example, Italy and Norway had only 4 and 3 percent of students, respectively, reaching the Advanced Benchmark, but nearly all students (90%) reaching the Low Benchmark.

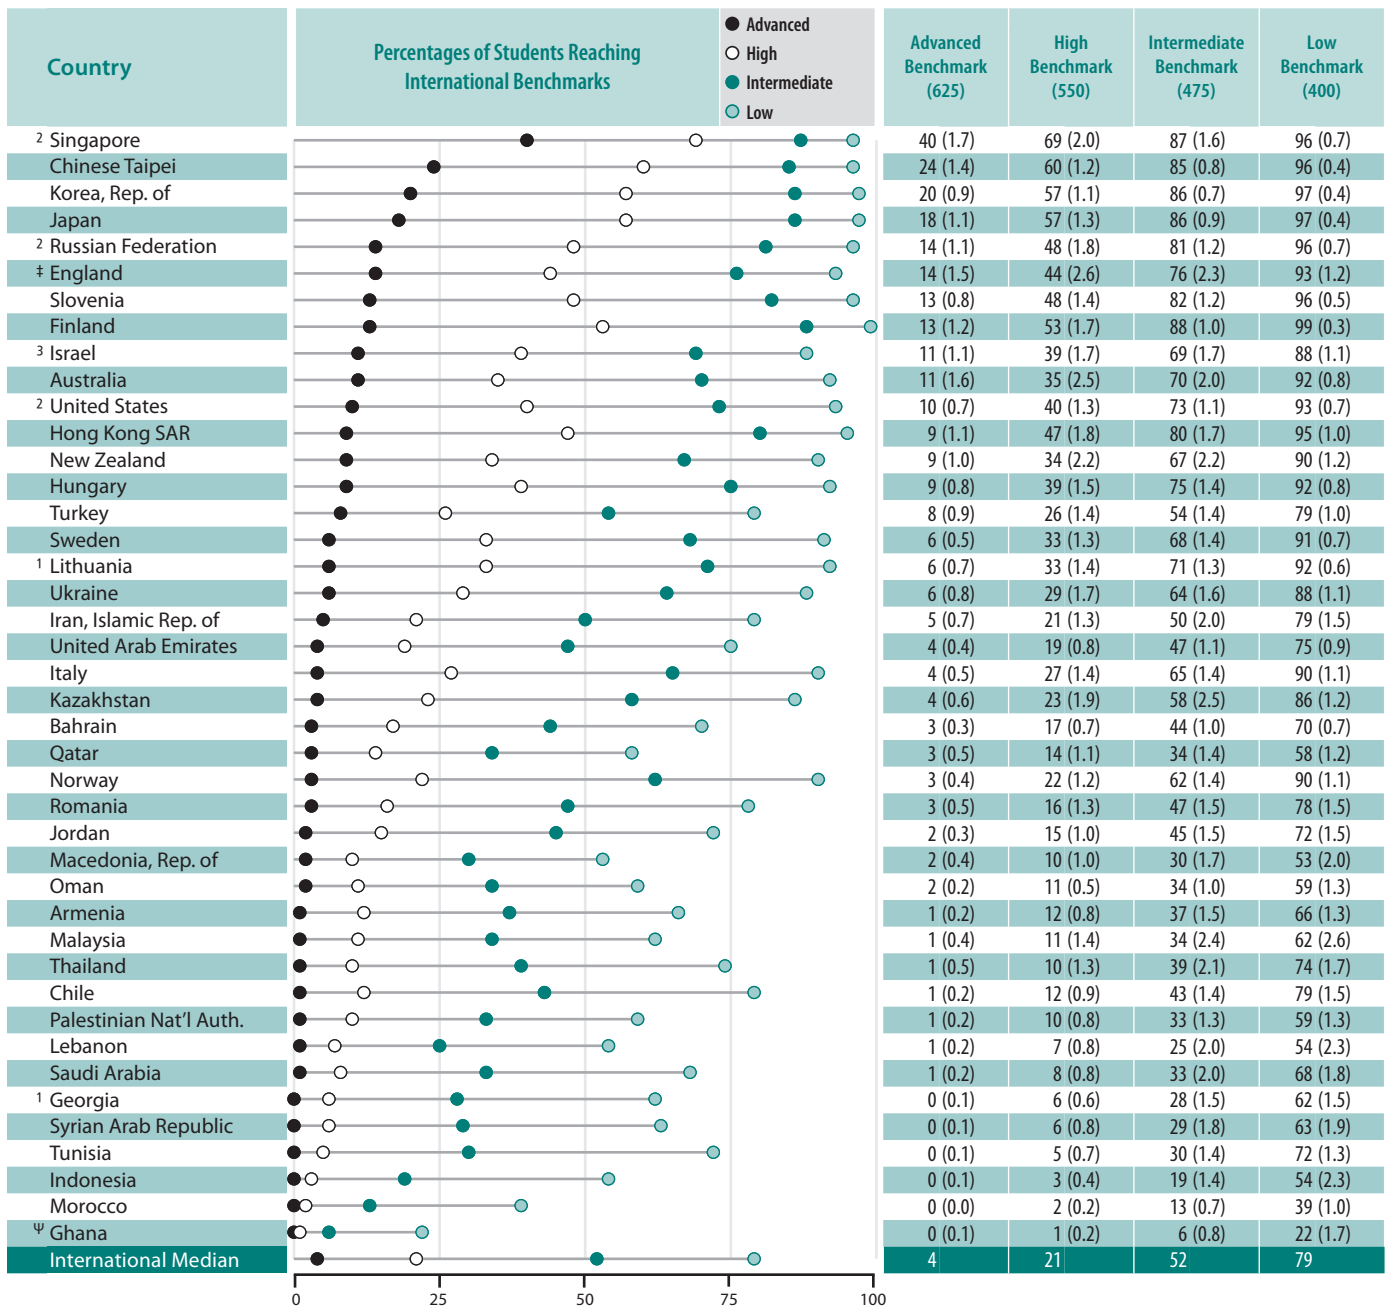

As a point of reference, Exhibit 2.18 provides the median for each of the benchmarks at the bottom of each of the four right hand columns. By definition, half of the countries will have a percentage in the column above the median and half will be below the median. The median percentages of students reaching the International Benchmarks were as follows: Advanced–4 percent, High–21 percent, Intermediate–52 percent, and Low–79 percent. In comparison to the fourth grade, these percentages were lower at each level. On average across countries, nearly half of the eighth grade students did not reach the Intermediate Benchmark, and more than one-fifth did not reach the Low Benchmark, indicating that, compared to the fourth grade, more eighth grade students were being “left behind” their classmates.

Eighth Grade Trends in Performance at the TIMSS 2011 International Benchmarks of Science Achievement

Exhibit 2.19 shows the changes in percentages of eighth grade students reaching the benchmarks for countries and benchmarking participants that also participated in TIMSS 1995, 1999, 2003, and/or 2007. An up arrow indicates that the percentage of students reaching a benchmark is higher in 2011 than the past cycle, and a down arrow indicates that the percentage is lower in 2011. The patterns in this exhibit generally mirror the trends in average achievement discussed in Chapter 1, and can provide further information about countries' improvement or decline over time.

Three countries—Korea, Slovenia, and Lithuania—improved since 1995 at all four benchmarks. The Russian Federation, Hong Kong, Iran, and the Canadian province of Ontario showed improvements at three benchmarks since 1995, and the United States showed improvement at the two lowest benchmarks. Since 1995, three countries declined at all four benchmarks: Hungary, Sweden, and Norway. Singapore declined since 1995 at the two lowest benchmarks, and Romania declined at the two highest benchmarks.

Eighth Grade TIMSS 2011 Low International Benchmark

Exhibit 2.20 presents the detailed description of student achievement at the Low International Benchmark. At this benchmark, students recognized some basic facts from the life and physical sciences, and interpreted simple pictorial diagrams, completed simple tables, and applied their basic knowledge to practical situations.

In biology at the eighth grade, the TIMSS 2011 Science Framework expects that students should be able to compare biological processes at the cellular level, including ideas about heredity. Exhibit 2.21 presents Example Item 1, which required students to recognize the basic biological fact that genetic material is inherited from both parents. On average across countries, this item was relatively easy and was answered correctly by 83 percent of the eighth grade students. In all countries and benchmarking jurisdictions, more than 60 percent of students answered the item correctly.

In chemistry at this benchmark level, students had some basic knowledge of chemical formulas. Exhibit 2.22 presents Example 2, in which students must recognize the chemical formula for carbon dioxide. On average across countries, this item also was relatively easy, with 85 percent of eighth grade students answering it correctly.

● **Low International Benchmark**

400

Summary

Students can recognize some basic facts from the life and physical sciences. They have some knowledge of biology, and demonstrate some familiarity with physical phenomena. Students interpret simple pictorial diagrams, complete simple tables, and apply basic knowledge to practical situations.

Students demonstrate some basic knowledge of biology. For example, they recognize that influenza is caused by a virus and that genetic material is inherited from both parents.

In chemistry and physics, students have some basic knowledge of chemical formulas and properties of substances as they change states. They recognize some aspects of conductivity and energy. For example, they recognize which material is a conductor of electricity and the type of energy in a compressed spring.

Students interpret simple pictorial diagrams, complete simple tables, and apply basic knowledge to practical situations.

Description: Recognizes that genetic material is inherited from both parents

Twins are born. One is a boy and one is a girl.

Which statement is correct about their genetic makeup?

- (A) The boy and girl inherit genetic material from the father only.
- (B) The boy and girl inherit genetic material from the mother only.
- The boy and girl inherit genetic material from both parents.
- (D) The boy inherits genetic material from the father only and the girl inherits it from the mother only.

Eighth Grade TIMSS 2011 Intermediate International Benchmark

Exhibit 2.23 provides the detailed description of student achievement at the Intermediate International Benchmark. Students at this level recognized and applied their understanding of basic scientific knowledge in various contexts. They also interpreted information from tables, graphs, and pictorial diagrams, and drew conclusions, as well as communicated their understanding through brief descriptive responses.

Exhibit 2.24 presents Example Item 3, which illustrates a competence typical of the eighth grade Intermediate International Benchmark: interpret a graph and recognize what can be concluded from the data presented in the graph. The international average percent correct for this item was 57 percent, although in some of the highest-performing countries (Japan, Korea, and Finland) 80 percent or more of the students answered the item correctly.

In earth science at this benchmark level, students demonstrated an elementary understanding of Earth's processes. Exhibit 2.25 presents Example Item 4, an item in the earth science domain which requires students to apply their understanding of the processes of the water cycle. On average across countries, 63 percent of the eighth grade students correctly numbered each process in the order in which it takes place. However, the percentage of students answering correctly varied greatly across countries (14–92%), indicating that this particular earth science topic may be more widely taught in some countries than others.

● Intermediate International Benchmark

475

Summary

Students recognize and apply their understanding of basic scientific knowledge in various contexts. Students apply knowledge and communicate an understanding of human health, life cycles, adaptation, and heredity, and analyze information about ecosystems. They have some knowledge of chemistry in everyday life and elementary knowledge of properties of solutions and the concept of concentration. They are acquainted with some aspects of force, motion, and energy. They demonstrate an understanding of Earth's processes and physical features, including the water cycle and atmosphere. Students interpret information from tables, graphs, and pictorial diagrams and draw conclusions. They apply knowledge to practical situations and communicate their understanding through brief descriptive responses.

In biology, students demonstrate some understanding of human health. For example, students understand how vaccination helps prevent illness and which cells destroy bacteria. They also state why exercise is important for good health. Students apply their knowledge of life cycles, adaptation, and heredity. They recognize that a tree has growth rings. They also explain that an animal's coloration protects it from predators and that an acquired characteristic cannot be passed on to the next generation. Students interpret and explain information about ecosystems and the effect of population changes. They recognize an organism that is a producer. They analyze information about a lake ecosystem and explain how an introduced population can affect an existing population.

Students have some knowledge of chemistry in everyday life. For example, they recognize that a fire can be stopped by cutting off the supply of oxygen, they recognize, from a description of indicator color changes, that neutralization has occurred, and, in the context of an investigation, they recognize the condition under which nails would rust. Students also have elementary knowledge of properties of solutions and the concept of concentration. They identify which of two solutions is more dilute and justify their selection.

In physics, students are acquainted with some aspects of force, motion, and energy. For example, they recognize the position of a fulcrum that requires the least amount of force to move a heavy object. Given a diagram showing a ball being thrown upward, they state the force that causes the ball to fall. In addition, students draw conclusions from a line graph showing the results of an investigation comparing two heat sources.

In earth science, students demonstrate an elementary understanding of Earth's processes and physical features. They describe a cause of earthquakes, recognize where active volcanoes are found and which soil change is due to a natural cause rather than human activity. Students demonstrate an understanding of the water cycle and knowledge of atmospheric conditions. They order the processes involved in the water cycle and match each process with its description. They recognize that air temperature at high altitudes is very low and that carbon dioxide is increasing over time in Earth's atmosphere.

Students interpret information from tables, graphs, and pictorial diagrams and draw conclusions. They apply knowledge to practical situations and communicate their understanding through brief descriptive responses.

Description: Interprets a graph showing changes in pulse rates before, during, and after exercise and recognizes what can be concluded from the graph

John measures his pulse rate before he exercises. It is 70 beats per minute. He exercises for one minute and measures his pulse rate again. He then measures it every minute for several minutes. He draws a graph to show his results.

What can be concluded from his results?

- (A) His pulse rate increased by 50 beats per minute.
- (B) His pulse rate took less time to slow down than to increase.
- (C) His pulse rate after 4 minutes was 80 beats per minute.
- His pulse rate returned to normal in less than 6 minutes.

Description: Given a starting point, orders the processes involved in the water cycle

The following five statements describe processes involved in the water cycle. Water evaporation from the sea is identified as a first step in the water cycle.

Number the other statements 2 through 5 in the order in which these processes take place.

- 2 Water vapor rises in warm air.
5 Water travels along a river to the sea.
1 Water evaporates from the sea.
3 Water vapor is cooled and forms clouds.
4 Clouds move and water falls on land as rain.

The answer shown illustrates the type of student response that was given 1 of 1 points.

Eighth Grade TIMSS 2011 High International Benchmark

Exhibit 2.26 presents the detailed description of achievement at the High International Benchmark. Eighth grade students at this level demonstrated understanding of concepts related to science cycles, systems, and principles. They also demonstrated some scientific inquiry skills, and combined and interpreted information from various types of diagrams, contour maps, graphs, and tables; selected relevant information, analyzed, and drew conclusions; and provided short explanations conveying scientific knowledge.

Example Item 5, shown in Exhibit 2.27, illustrates an item in the chemistry domain that requires reasoning. Students were asked to identify a property of metals and describe how this property could be used to determine whether an unknown substance is a metal or nonmetal. This item demonstrates the increasing sophistication in knowledge and skill demonstrated by students at the High International Benchmark, which is reflected in an international average percent correct of 35 percent.

Exhibit 2.28 presents Example Item 6, an item from the physics domain that requires students to recognize that molecules of a liquid slow down as the liquid cools. This multiple choice item was relatively less difficult than Example Item 5, with 58 percent of eighth grade students, on average, answering the item correctly.

Example Item 7, shown in Exhibit 2.29, illustrates a competence typical of students reaching the eighth grade High International Benchmark—interpreting information appearing in various types of diagrams (in this case, a contour map). This item was moderately difficult; on average across countries, 38 percent of students answered it correctly. As with Example Item 4, there was particularly wide variation across countries in the percentage of students answering this item correctly (4–84%), indicating that this topic also may be more widely taught in some countries than others.

○ **High International Benchmark**

550

Summary

Students demonstrate understanding of concepts related to science cycles, systems, and principles. They demonstrate understanding of aspects of human biology, and of the characteristics, classification, and life processes of organisms. Students communicate understanding of processes and relationships in ecosystems. They show an understanding of the classification and compositions of matter and chemical and physical properties and changes. They apply knowledge to situations related to light and sound and demonstrate basic knowledge of heat and temperature, forces and motion, and electrical circuits and magnets. Students demonstrate an understanding of the solar system and of Earth's processes, physical features, and resources. They demonstrate some scientific inquiry skills. They also combine and interpret information from various types of diagrams, contour maps, graphs, and tables; select relevant information, analyze, and draw conclusions; and provide short explanations conveying scientific knowledge.

In biology, students demonstrate an understanding of aspects of human biology. For example, they recognize the food that is a good source of carbohydrates, recognize what happens to biceps and triceps when an elbow bends, and state one function of the uterus. They also demonstrate an understanding of characteristics, classification, and life processes of organisms. Students classify animals based on physical and behavioral characteristics. They indicate which gas is released into the air and which gas is removed during photosynthesis and animal respiration. Students communicate understanding of processes and relationships in ecosystems. They interpret food chains and recognize competition and predation relationships. They recognize factors that are likely to lead to a change in population size and can predict how populations change over time. They justify whether or not planting trees to decrease the amount of carbon dioxide in a city is a good decision.

In chemistry, students show an understanding of the classification and composition of matter. For example, students recognize elements and compounds from a list of symbols and formulas and recognize a diagrammatic representation of the structure of a water molecule. Given the chemical formula for an acid, they identify the number of atoms of each element in the molecule and the state of each of three substances at a given temperature from a table of melting and boiling points. Students show an understanding of chemical and physical properties and changes. They identify a property of metals and use it to determine whether an unknown substance is a metal or nonmetal, and they recognize chemical processes in everyday activities that involve energy absorption and release. Students use information presented in several tables to work through a multi-step investigation about the mass and density of gold jewelry.

In physics, students apply their knowledge of forces and motion to everyday and abstract situations. For example, they can identify the forces acting on students sitting on a wall. In addition, they recognize an object likely to be used as a lever. Students apply knowledge about the relationship between depth and pressure in water. Given a diagram showing densities of objects and liquids and the objects floating or sinking in the liquids, they identify each liquid. Students apply knowledge to situations related to light and sound. They recognize the pathway of light for an object to be seen, apply their knowledge of light rays reflecting to identify the orientation of a hidden mirror, and explain why lightning is seen before thunder is heard. Students demonstrate basic knowledge of heat and temperature. They recognize what happens to gas and liquid molecules when temperature changes. In the context of an investigation, students explain the effect of temperature on diffusion. Students show an understanding of electrical circuits and properties of magnets and electromagnets. They explain which light bulbs in parallel and series arrangements are affected when one of them breaks. They also recognize how to increase the strength of an electromagnet.

In earth science, students demonstrate an understanding of Earth's processes, physical features, and resources. For example, they interpret a contour map to recognize a topographical representation of a mountain top, recognize a non-renewable energy source, and state a way that a volcanic eruption impacts the environment. Also, based on a graph of average monthly temperature, they recognize which city is most likely to be located at the equator. Students demonstrate an understanding of the solar system. They recognize the gravitational pull of the moon on Earth as the major cause of tides. They also recognize the main difference between planets and moons, and apply knowledge about rotation and day length to recognize which planet has the shortest day length.

Students demonstrate some scientific inquiry skills. They select and justify an appropriate experimental method. They combine and interpret information from various types of diagrams, contour maps, graphs, and tables; select relevant information, analyze and draw conclusions; and provide short explanations conveying scientific knowledge.

Description: Identifies a property of metals and describes how this property can be used to determine whether an unknown substance is a metal or nonmetal

David is given a sample of an unknown solid substance. He wants to know if the substance is a metal. Write down one property he can observe or measure and describe how this property could be used to help identify whether the substance is a metal.

Metals conduct electricity.

He could make a simple electrical circuit with the sample, a battery, and a light bulb. If the bulb lights when everything is connected correctly, the sample is probably a metal.

The answer shown illustrates the type of student response that was given 1 of 1 points.

Eighth Grade TIMSS 2011 Advanced International Benchmark

Exhibit 2.30 presents the detailed description of eighth grade performance at the Advanced International Benchmark. At this benchmark, students communicated an understanding of complex and abstract concepts in biology, chemistry, physics, and earth science. They also combined information from several sources to solve problems and draw conclusions, and could provide written explanations to communicate scientific knowledge.

● **Advanced International Benchmark**

625

Summary

Students communicate an understanding of complex and abstract concepts in biology, chemistry, physics, and earth science. Students demonstrate some conceptual knowledge about cells and the characteristics, classification, and life processes of organisms. They communicate an understanding of the complexity of ecosystems and adaptations of organisms, and apply an understanding of life cycles and heredity. Students also communicate an understanding of the structure of matter and physical and chemical properties and changes and apply knowledge of forces, pressure, motion, sound, and light. They reason about electrical circuits and properties of magnets. Students apply knowledge and communicate understanding of the solar system and Earth's processes, structures, and physical features. They understand basic features of scientific investigation. They also combine information from several sources to solve problems and draw conclusions, and they provide written explanations to communicate scientific knowledge.

In biology, students demonstrate some knowledge of concepts related to cells and their functions and the characteristics, classification, and life processes of organisms. For example, they recognize a function of the cell membrane and state a life function of a single-celled organism other than taking in nutrients. They also recognize an organism in which oxygen and carbon dioxide are exchanged through the skin. Students apply an understanding of life cycles and heredity in practical situations. They describe an investigation to find out how fertilizer affects the growth of plants, apply knowledge about heredity to explain why offspring have traits like their parents, and recognize and describe an example of asexual reproduction. Students demonstrate understanding of the complexity of ecosystems and adaptations of organisms to their environment. They demonstrate some appreciation of the impact of human population growth on the environment and know some animal adaptations needed for survival, including both physical and behavioral characteristics. They also apply knowledge of competition to explain the importance of removing weeds from a field where crops are sown.

In chemistry, students demonstrate an understanding of the structure and the physical and chemical properties of matter. For example, they recognize that protons, neutrons, and electrons make up atoms and that atoms make up molecules; recognize what happens to atoms in an object if the shape of the object changes; and classify examples of matter as elements, compounds, or mixtures. Students apply knowledge of expansion of water during freezing and of density to explain why oil floats on water. In the context of an investigation of an irregularly shaped object, they describe the measurements needed to find the volume of the object. Students communicate understanding of physical and chemical changes. They recognize the graph that most likely shows the effect of temperature on solubility and recognize an everyday process that is an example of a physical change. Students describe what might be observed when a chemical reaction takes place. They identify which everyday liquids can neutralize a base and recognize a property common to both acids and bases. They apply knowledge of conservation of mass during neutralization and other chemical reactions.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

● **Advanced International Benchmark**

625

In physics, students demonstrate a good understanding of states of matter and phase change. For example, students identify from a list of characteristics or properties those that change or remain the same as a liquid changes into a gas. Using knowledge that only gases fill an available space, they infer the spacing of particles in different samples of matter. Students can reason about electrical circuits and properties of magnets. They recognize how the arrangement of components in an electrical circuit affects the battery life and brightness of a light bulb. Students describe how to use a magnet to determine whether a metal bar is a magnet and recognize the relationship between the strength of a magnet and the number of paper clips it attracts. Students apply knowledge of forces, pressure, and motion. They explain the relationship between the orientation of a rectangular block and the pressure it exerts on the ground. Students apply knowledge of sound and light in everyday situations. They predict the effect of removing air from an enclosed jar on the propagation of sound in the jar, and, on a diagram of a person looking through a periscope, draw the path and direction of a light ray passing through it.

In earth science, students apply knowledge and communicate their understanding of Earth's processes, structures, and physical features. For example, they explain how planting trees and terraced farming affects soil erosion. Given a diagram showing weather conditions at different elevations on a mountain, they identify the most likely location of a jungle. They also show understanding of the conditions under the Earth's surface by explaining why water from an artesian well can be hot, and state what fossil evidence would support the idea that two continents were once joined. Students apply knowledge and communicate understanding of the solar system. They recognize why the moon appears to change shape during the month and how a shadow changes as the sun moves. They also explain why an object's weight is less on the Moon than on Earth.

Students understand basic aspects of scientific investigation. In an experimental situation, they identify which variables to control and can design an investigation. They compare information from several sources, combine information to predict and draw conclusions, and interpret information in diagrams, maps, graphs, and tables to solve problems. They provide written explanations to communicate scientific knowledge.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Exhibit 2.31 presents Example Item 8, which requires students to communicate their understanding of an important concept in chemistry, in this instance by describing the kinds of changes that take place during a chemical reaction. To receive full credit for this constructed response item, students were required to describe two kinds of changes. On average across countries, only 24 percent of students were able to do so.

Example Item 9 in Exhibit 2.32 asks students to demonstrate their understanding of a complex, abstract concept in physics by recognizing that the force of gravity acts on a person regardless of position and movement. On average internationally, 32 percent of the eighth grade students answered this item correctly, although as with many example items, there was great variation across countries, ranging from 13 to 63 percent correct.

The TIMSS 2011 Science Framework describes scientific inquiry as a cross-cutting theme in the TIMSS science assessment. Eighth grade students are expected to be able to propose explanations of scientific phenomena based on evidence. Example Item 10 displayed in Exhibit 2.33, an item from the earth science domain, asks students to present fossil evidence to support the idea that two continents were once joined. Students found this item challenging. On average across the countries, only 18 percent of students were able to provide a correct answer.

Chapter 3

International Student Achievement in the TIMSS Science Content and Cognitive Domains

Generally, TIMSS 2011 participants with the highest achievement overall also had the highest achievement in the science content domains (e.g., biology and physics). Internationally, more countries demonstrated relative strengths in knowing science than in applying scientific knowledge and reasoning.

As described in the *TIMSS 2011 Assessment Frameworks*, the science assessment is organized around two dimensions: a content dimension specifying the subject matter or content domains to be assessed in science, and a cognitive dimension specifying the thinking processes that students are likely to use as they engage with the content. Each item in the science assessment is associated with one content domain and one cognitive domain, providing for both content-based and cognitive-oriented perspectives on student achievement in science.

There are three content domains at the fourth grade: life science, physical science, and earth science; and there are four domains at the eighth grade: biology, chemistry, physics, and earth science. The same three cognitive domains—knowing, applying, and reasoning—were used at both the fourth and eighth grades. Knowing covers the student’s knowledge of science facts, procedures, and concepts. Applying focuses on the student’s ability to apply knowledge and conceptual understanding in a science problem situation. Reasoning goes beyond the solution of routine science problems to encompass unfamiliar situations, complex contexts, and multi-step problems.

Chapter 3 presents the TIMSS 2011 results at the fourth and eighth grades for the content and cognitive domains. Previous TIMSS assessments have found that most countries performed relatively better in one or another of the content domains, and similarly, that countries can have relative strengths in one content domain compared to another. In addition to providing TIMSS 2011 average achievement for the content and cognitive domains, the chapter provides changes in achievement in the domains compared to TIMSS 2007, and achievement differences by gender.

Relative Achievement by Science Content Domains

Exhibit 3.1 presents the average achievement for TIMSS 2011 participants in the fourth grade content domains of life science, physical science, and earth science relative to overall fourth grade science achievement. To provide a way for the TIMSS 2011 participants to examine relative performance in the content domains, IRT scaling was used to place achievement in each of the three domains on the TIMSS fourth grade science scale. The items on which the content domains were based varied in difficulty, as shown in Appendix B.3, which displays the average percent correct across the items in each domain. For example, internationally, the fourth grade students found the life science and physical science items to be somewhat less difficult (48% and 49% correct) than the earth science items (46%), on average. As shown in Appendix B.4, there

was larger variation in the difficulty of the eighth grade content domains, with physics most difficult (38% correct, on average), followed by biology (42%), chemistry (43%), and earth science (45%). However, the scaling process took the differences in difficulty into account, so that average achievement for each of the content domains can be compared relative to overall science achievement at each grade level.

In Exhibit 3.1, the first column presents average overall science achievement, and the next columns show average achievement in the three content domains of life science, physical science, and earth science. TIMSS 2011 participants are presented in order by overall science achievement, first for the fourth grade, followed by the sixth grade and the benchmarking participants. The average scale score for each content domain is shown, together with the difference between achievement in overall science and achievement in the content domain. Up and down arrows are used to indicate whether a country's average content domain score is significantly higher or lower than its overall science average score.

Generally, the TIMSS 2011 participants with the highest achievement overall also had the highest achievement in the content domains. However, many countries performed relatively higher in one or two of the content domains compared to their overall performance; and relatively lower in one or two others. For example, among the top-performing countries, Korea performed relatively better in physical science and earth science than in science overall, and relatively less well in life science; Singapore performed relatively better in life science and physical science, but relatively less well in earth science; and Finland performed equally well in all three domains. Looking across the results in Exhibit 3.1, there is considerable diversity among countries with regard to their relative strengths and weaknesses in the content domains. At the fourth grade, in only four countries and one benchmarking participant was performance in each of the three content areas relatively the same as in science overall (Denmark, Finland, Ireland, Romania, and the Canadian province of Alberta).

Exhibit 3.2 presents average achievement in the eighth grade content domains of biology, chemistry, physics, and earth science. Similar to the fourth grade, there is considerable diversity in countries' strengths and weaknesses in the content domains, even among the high-achieving Asian countries. For example, although the differences were sometimes small, Singapore performed somewhat better in biology and physics than in science overall, and less well

in earth science. Chinese Taipei performed better in chemistry and earth science than in science overall and less well in biology and physics, while Korea performed better in physics relative to science overall and less well in chemistry and earth science. Japan performed better in biology relative to overall science and less well in earth science. Looking across all of the countries, only the UAE emirate of Abu Dhabi had performance in each of the four content areas that was no different than in science overall.

Relative Achievement by Science Cognitive Domains

Exhibits 3.3 and 3.4 present average achievement at the fourth and eighth grades, respectively, in the cognitive domains of knowing, applying, and reasoning relative to overall science achievement for TIMSS 2011 participants. Because these three scales represent quite different skills, it was expected that the assessment items would have different difficulty levels. The average percent correct in the cognitive domains shown in Appendix E were 53 percent for knowing, 46 percent for applying, and 41 percent for reasoning at the fourth grade, and 49 percent, 41 percent, and 33 percent, respectively, at the eighth grade. However, as with the content domains, the IRT scaling adjusts for these difficulty levels and allows achievement in the three cognitive domains to be placed on the overall science scales for the fourth and eighth grades, so that TIMSS 2011 participants can compare performance in each of the three cognitive domains relative to overall science achievement.

The presentation of results for the cognitive domains in Exhibits 3.3 and 3.4 follows the layout of results for the content domains (Exhibits 3.1 and 3.2). Similar to the results for the content domains, in general, the TIMSS 2011 participants with the highest science achievement overall also had highest achievement in the cognitive domains, although most countries showed a relative strength in one cognitive domain or another.

Among the top-performing countries at the fourth grade, there was no consistent pattern of strength or weakness in the cognitive domains; with regard to science overall, some countries performed relatively well in knowing, some performed relatively well in applying, and some performed relatively well in reasoning. In only four countries and three benchmarking participants was performance in each of the three cognitive domains no different from science performance overall: Australia, Belgium (Flemish), New Zealand, and Chile, and the Canadian provinces of Alberta, Ontario, and Québec.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Similar to the fourth grade, at the eighth grade there was much variability across countries in relative strengths or weaknesses in the cognitive domains, and only in two countries and three benchmarking participants was performance in each of the three cognitive domains relatively the same as in science overall: the top-performing country of Singapore, Lithuania, the province of Québec, and the states of California and Minnesota. More eighth and ninth grade participants had better performance relative to overall science in the knowing domain (19 countries and 8 benchmarking entities) than in the applying (6 countries and 1 benchmarking entity) and reasoning (10 countries and 4 benchmarking entities) domains.

Trends in Achievement in Science Content Domains

Exhibits 3.5 and 3.6 show changes from 2007 to 2011 in average achievement in the science content domains for fourth and eighth grade students, respectively. Countries are shown in alphabetical order, followed by the benchmarking participants.

Of the TIMSS 2011 fourth grade participants that also participated in 2007 and have comparable data, some had increases and some had decreases in average science achievement over the period. From Exhibit 1.5 it can be seen that nine countries (Czech Republic, Denmark, Georgia, Iran, Japan, the Netherlands, Norway, Sweden, and Tunisia) had higher average science achievement in 2011 than in 2007, and five countries (Australia, England, Hong Kong SAR, Italy, and New Zealand) had lower achievement. Exhibit 3.5 shows that in three of the countries with an overall increase—Czech Republic, Georgia, and Norway—the increase was due to improved performance in all three science content domains. However, in Denmark, the Netherlands, and Sweden, the increase was due mainly to improvement in physical science, and in Iran and Japan due to increased performance in both physical and earth science. In Tunisia, the increase was due to improvement in life science and earth science. Among the countries with a decrease in overall science achievement, only Hong Kong SAR decreased in all three content domains. Of the others, the decline in Australia and New Zealand was due mainly to a drop in life and earth science performance; in England it was due to lower physical and earth science achievement; and in Italy it was due to a decrease in life and physical science achievement.

Although not showing overall increases in science achievement between 2007 and 2011, Austria and the Slovak Republic both had increased achievement

in physical science. Slovenia also had no overall science achievement difference, but had increased achievement in life science and a decrease in earth science. Singapore and the two Canadian provinces of Alberta and Ontario, also with no overall difference, had a decrease in earth science achievement.

Of the TIMSS 2011 eighth grade participants with comparable data from 2007, some had increased average science achievement over the period and some decreased. From Exhibit 1.6 it can be seen that seven countries (Iran, Korea, Norway, Palestinian Authority, Russian Federation, Singapore, and the Ukraine as well as the province of Québec and the state of Minnesota) had higher average science achievement in 2011 than in 2007, and seven countries had lower achievement (Bahrain, Hungary, Indonesia, Jordan, Malaysia, Syria, and Thailand). Exhibit 3.6 shows that only in Singapore and the province of Quebec was the overall increase due to improved performance in all four science content domains. In Iran, the increase was due to improved achievement in biology, chemistry, and physics; in Korea due to improved biology and chemistry; in Norway due to improved earth science; in the Palestinian Authority due to improved chemistry and physics; in the Russian Federation due to increased achievement in biology, chemistry, and physics; in the Ukraine due to improved biology, chemistry, and earth science; and in the state of Minnesota due to improved chemistry, physics, and earth science. In six of the seven countries with an overall decrease in science achievement, including Bahrain, Indonesia, Jordan, Malaysia, Syria, and Thailand, the decrease was evident in all four content domains. In Hungary, the remaining country, the decline was due to a drop in achievement in biology, physics, and earth science.

Although showing no change in overall in eighth grade science achievement between 2007 and 2011, several countries had improved performance in one or more content domains, including Chinese Taipei (earth science), Ghana (physics), Italy and Slovenia (chemistry, earth science), Japan (biology, earth science), and the United States as well as its state of Massachusetts (chemistry, physics). There were also several participants with lower achievement in one or more content domains in 2011 without having lower overall science achievement, including England, Lebanon, Oman, and Sweden (physics), and the province of Ontario (chemistry). Finally, a number of countries had a mixture of increases and decreases among the science content domains, including Georgia (increase in biology, decrease in chemistry); Lithuania (decrease in biology, increase in chemistry); and Tunisia (decrease in chemistry and earth science, increase in physics).

Trends in Achievement in Science Cognitive Domains

Exhibits 3.7 and 3.8 show changes from 2007 to 2011 in average achievement in the science cognitive domains for fourth and eighth grade students, respectively. As with the content domains, overall increases or decreases in science achievement since 2007 were reflected in increases or decreases in the cognitive domains. As shown in Exhibit 3.7, the overall increase in science achievement was the result of increases in all three cognitive domains in just two countries: Georgia and Norway. In the Czech Republic, the Netherlands, and Tunisia, the overall increase was due to increases in the knowing and applying domains, whereas in Denmark and Sweden it was the result of improvement in the applying domain. In Iran, the overall science increase was due to improved performance in knowing and reasoning, and in Japan due to improvements in applying and reasoning. Among countries with an overall decrease in science achievement, only in Hong Kong SAR was this decrease the result of lower achievement in all three cognitive domains. In Australia and England, the overall decrease was due to a decrease in knowing and reasoning, in Italy due to a decrease in applying and reasoning, and in New Zealand due to a decrease in knowing.

A number of countries had improved performance in one or more cognitive domains at the fourth grade without having an overall difference in science achievement between 2007 and 2011, including Austria (reasoning), the Slovak Republic and Slovenia (knowing), and the United States (applying). Singapore performed less well in knowing but better in reasoning. The Canadian provinces of Alberta and Ontario, while not having lower overall science achievement, performed less well in knowing, and Ontario also performed less well in reasoning.

Exhibit 3.8 shows that for three of the seven countries with higher average science achievement in 2011 than in 2007 (the Palestinian Authority, the Russian Federation, and Singapore), the increase was due to improved performance in all three science cognitive domains; whereas for Iran, it was due to improved performance in applying and reasoning, for Korea and Norway, in applying, and for the Ukraine in knowing and reasoning. The overall increases in the provinces of Québec and state of Minnesota were due to improved performance in knowing and applying. In all seven of the countries where overall science achievement decreased since 2007, this decrease was the result of lower achievement in all three cognitive domains.

Countries without an overall increase in eighth grade science achievement between 2007 and 2011, but with improved performance in one or more cognitive domains included Georgia (reasoning), Italy, the United States and the state of Massachusetts (knowing), and Slovenia (knowing and applying). Countries with a decrease in one or more cognitive domains but without an overall decrease in science achievement included Lebanon and Tunisia (knowing), and Lithuania (reasoning). Ghana, with no change in overall science achievement between 2007 and 2011, had a decrease in the knowing domain and an increase in reasoning.

Achievement in the Science Content and Cognitive Domains by Gender

Exhibits 3.9 and 3.10 present the TIMSS 2011 gender differences in average achievement for the content domains at the fourth and eighth grades. At the fourth grade, girls had higher achievement in life science than boys in 18 countries and one benchmarking entity, compared with four countries and no benchmarking participants where boys outperformed girls. Conversely, boys had higher achievement in physical science than girls in 25 countries and five benchmarking participants, compared with seven countries and one benchmarking participant where girls outperformed boys. Also, boys had higher achievement in earth science than girls in 20 countries and five benchmarking entities, compared with eight countries and one benchmarking participant where girls outperformed boys. On average across countries, girls had an 8-point advantage in life science, and boys had a 1-point advantage in physical science and a 4-point advantage in earth science. At the sixth grade, girls in Botswana and Yemen performed better than boys in life science, and boys in Honduras performed better than girls in earth science.

As shown in Exhibit 3.10, on average across the eighth grade countries, girls had a 12-point advantage in biology and a 10-point advantage in chemistry, while boys had a 2-point advantage in earth science. There was no significant difference between the achievement of girls and boys in physics. Girls outperformed boys in biology in 24 countries and two benchmarking entities, and in chemistry in 20 countries and one benchmarking participant. Boys outperformed girls in biology in seven countries and in chemistry in seven countries and four benchmarking entities. Boys outperformed girls in physics in 16 countries and eleven benchmarking participants, and in earth science in 16 countries and twelve benchmarking participants. Girls outperformed boys in physics in nine countries and one benchmarking entity, and in earth science in six countries and one benchmarking entity.

Exhibits 3.11 and 3.12 present gender differences in the cognitive domains for the fourth and eighth grades. On average across the fourth grade countries, girls had higher achievement than boys in the reasoning domain. In eight countries and one benchmarking participant, girls outperformed boys in all three cognitive domains (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, Tunisia, the United Arab Emirates, Yemen, and the emirate of Abu Dhabi), while in six countries and one benchmarking participant, boys outperformed girls in all three domains (Austria, Belgium-Flemish, Chile, the Czech Republic, Germany, Italy, and the province of Alberta).

At the eighth grade, on average across countries, girls outperformed boys in all three of the cognitive domains. Specifically, girls outperformed boys in all three domains in twelve countries and one benchmarking participant (Armenia, Bahrain, Georgia, Jordan, Macedonia, Malaysia, Oman, the Palestinian National Authority, Qatar, Thailand, Turkey, the United Arab Emirates, and the emirate of Dubai). Conversely, boys outperformed girls in all three domains in seven countries and one benchmarking participant (Chile, Ghana, Hungary, Italy, New Zealand, Tunisia, Honduras, and the state of Indiana).

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Chapter 4

Home Environment Support for Science Achievement

Home resources for learning and high expectation by parents and students for education were related to higher average achievement at the fourth and eighth grades.

Considerable research supports the fundamental importance of a supportive home environment in shaping children's achievement in school. Internationally, IEA studies in science through four cycles of TIMSS have found a strong positive relationship between students' science achievement at the fourth and eighth grades and home environments that foster learning.

This chapter presents the fourth grade TIMSS 2011 science achievement results in relation to parents' reports about the following: 1) their children's home resources for learning, 2) their children's language experiences before starting school, 3) their educational expectations for their children, and 4) their children's attendance at preprimary education. The parents' data were collected using the *TIMSS & PIRLS 2011 Learning to Read Survey* in which students' parents or primary caregivers were asked to provide information about their child's home environment and early educational experiences, and so are available only for countries that administered both TIMSS and PIRLS to the same fourth grade students. The chapter also presents the eighth grade science achievement in relation to students' own reports about several aspects of their home environment and their educational expectations.

Home Resources for Learning

The *TIMSS & PIRLS 2011 Learning to Read Survey* asked students' parents to report on the availability of three key home resources highly related to student achievement in school:

- ◆ Parents' education;
- ◆ Parents' occupation; and
- ◆ Number of children's books in the home.

In addition, students were asked about:

- ◆ Number of books in the home; and
- ◆ Availability of two study supports at home—An Internet connection and their own room.

Research consistently shows a strong positive relationship between achievement and socioeconomic status (SES), or indicators of socioeconomic status such as parents' or caregivers' level of education or occupation. TIMSS, PIRLS, and PISA have found strong positive relationships between level

of parents' education and/or occupation and their children's educational attainment. In general, higher levels of education can lead to careers in higher paying professions, higher socioeconomic status, and more home resources. However, the benefits of higher levels of parents' education can extend to having more positive beliefs and higher expectations toward educational achievement transfer to their children. Availability of reading material in the home likewise is strongly related to achievement in mathematics and science as well as in reading. IEA's TIMSS studies have consistently shown that students with a large number of books in the home have higher achievement in mathematics and science.

Exhibit 4.1 presents the results for the TIMSS 2011 Home Resources for Learning scale, which was created based on parents' and students' reports about the five types of home resources described above. Results are shown for countries that administered both TIMSS and PIRLS fourth grade assessments to the same fourth grade students. The second page of the exhibit provides detail about the questions forming the scale and the categorization of responses. Students were scored according to the availability of the five home resources, with **Many Resources** corresponding to more than 100 books in the home, having both their own room and an Internet connection, more than 25 children's books, at least one parent having completed university, and one with a professional occupation, on average. **Few Resources** corresponds, on average, to having 25 or fewer books, neither of the home study supports, 10 or fewer children's books, neither parent having gone beyond upper secondary school, and neither having a business, clerical, or professional occupation.

Countries are ordered by the percentage of students in the **Many Resources** category, with the fourth grade countries on the first page of the exhibit and the sixth grade and benchmarking participants on the second page. Internationally, on average, almost three-quarters of the fourth grade students (74%) were assigned to the **Some Resources** category. Seventeen percent, on average, were in the **Many Resources** category and nine percent internationally were in the **Few Resources** category, with a 131-point difference in their average science achievement (559 vs. 428). Students in the countries participating at the sixth grade had relatively few home resources, comparable to the fourth grade countries with the lowest levels of resources.

Exhibit 4.1: Home Resources for Learning*

Reported by Parents, except Number of Books and Study Supports Reported by Students

Students were scored according to their own and their parents' responses concerning the availability of five resources on the *Home Resources for Learning* scale. Students with **Many Resources** had a score of at least 11.9, which is the point on the scale corresponding to students reporting they had more than 100 books in the home and two home study supports, and parents reporting that they had more than 25 children's books in the home, that at least one parent had finished university, and that at least one parent had a professional occupation, on average. Students with **Few Resources** had a score no higher than 7.3, which is the scale point corresponding to students reporting that they had 25 or fewer books in the home and neither of the two home study supports, and parents reporting that they had 10 or fewer children's books in the home, that neither parent had gone beyond upper-secondary education, and that neither parent was a small business owner or had a clerical or professional occupation, on average. All other students were assigned to the **Some Resources** category.

* Available only for countries that administered both TIMSS and PIRLS to the same fourth grade students because this item was included in the PIRLS Home Questionnaire completed by parents.

Centerpoint of scale set at 10.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

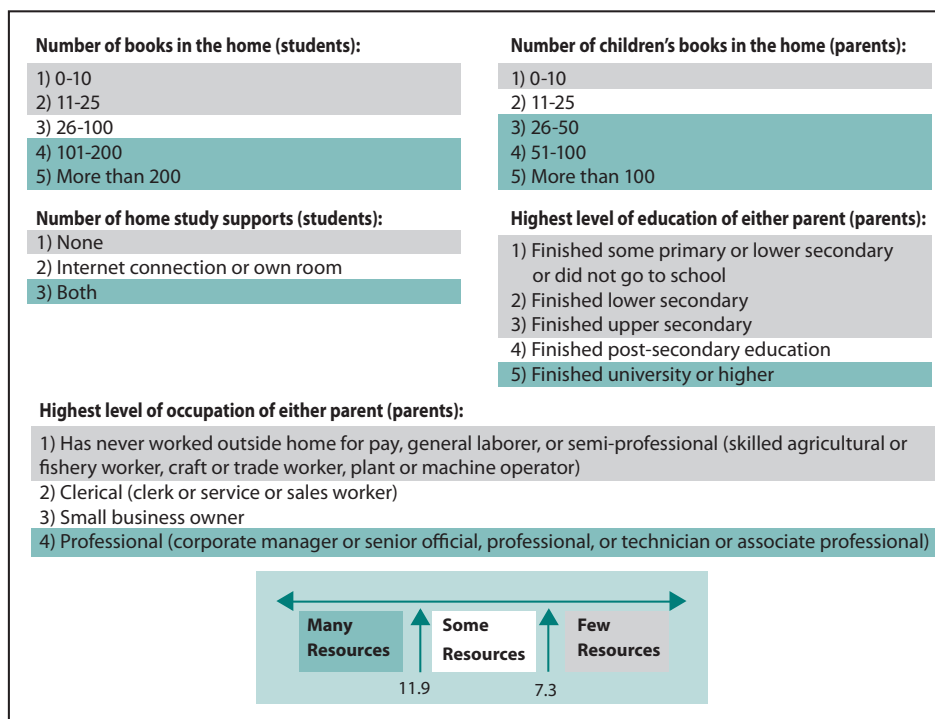

Exhibit 4.2 provides supporting detail about the availability of the specific home resources included in the Home Resources for Learning scale for the fourth grade assessment. The exhibit presents data on two resource components (More than 100 Books in Their Home as well as both Own Room and Internet Connection in Home) for all participants in the fourth grade TIMSS assessment, as well as data on an additional three resources for countries that participated in both TIMSS and PIRLS with the same students. On average, across all of the countries participating in TIMSS 2011 at the fourth grade, one-fourth of the students were from homes with more than 100 books in total, and slightly more than half (52%) reported having both their own room and an Internet connection at home. Across the countries participating in both studies at the fourth grade, on average, 30 percent of the students had at least one parent that had earned a university degree and 36 percent had at least one parent in a professional occupation, and the majority of students (58%) had more than 25 children's books at home.

Exhibit 4.3 presents the results for the TIMSS 2011 eighth grade assessment for the Home Educational Resources scale, which was created based on students' reports about three of the five types of home resources that comprised the fourth grade Home Resources for Learning scale—number of books in the home, availability of two home study supports, and parents' education. The second page of the exhibit provides detail about the questions forming the scale and the categorization of responses. Students were scored according to the availability of the three home study supports, with **Many Resources** corresponding to more than 100 books in the home, having both their own room and an Internet connection, and at least one parent having completed university, on average. **Few Resources** corresponds, on average, to having 25 or fewer books, neither home study support, and neither parent having gone beyond upper secondary school.

Countries are ordered by the percentage of students in the **Many Resources** category, with the eighth grade countries on the first page of the exhibit and the ninth grade and benchmarking participants on the second page. Internationally, on average, two-thirds of the eighth grade students (67%) were assigned to the **Some Resources** category. On average, twelve percent were in the **Many Resources** category and 21 percent were in the **Few Resources** category, with a 116-point difference in their average science achievement (540 vs. 424).

Exhibit 4.4 provides supporting detail about the availability of the specific home resources included in the Home Educational Resources scale for the eighth grade assessment. Across the countries participating at the eighth grade, on average, one-fourth of the students had more than 100 books in their home, more than half (53%) reported having both their own room and an Internet connection at home, and about one-third (32%) had at least one parent that had earned a university degree.

* Data reported in columns 3-5 were from the PIRLS Home Questionnaire completed by parents, so data are available only for countries that administered both TIMSS and PIRLS to the same fourth grade students.

** Includes corporate manager or senior official, professional, and technician or associate professional.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

Exhibit 4.3: Home Educational Resources

Reported by Students

Students were scored according to their responses concerning the availability of three home educational resources on the *Home Educational Resources* scale. Students with **Many Resources** had a score of at least 12.5, which is the point on the scale corresponding to students reporting that they had more than 100 books in the home and two home study supports, and that at least one parent had finished university, on average. Students with **Few Resources** had a score no higher than 8.2, which is the scale point corresponding to students reporting that they had 25 or fewer books in the home, neither of the two home study supports, and that neither parent had gone beyond upper-secondary education, on average. All other students were assigned to the **Some Resources** category.

Students Spoke the Language of the Test

TIMSS has previously shown that, with some exceptions, countries with large proportions of students from homes where the language of the test (and consequently the language of instruction) is not often spoken had lower average science achievement than students who spoke the language of the test more often. Because learning any school subject is dependent on having a mastery of the language of instruction, which in turn is influenced by children's early language experiences, the language or languages spoken at home and how they are used are important factors in subsequent school achievement. As formal science instruction begins, children are likely to be at an initial disadvantage if their knowledge of the language of instruction is substantially below the expected level for their age.

Exhibit 4.5 shows parents' reports about whether students who participated in the fourth grade TIMSS 2011 assessment spoke the language of the test before starting school. For students in the fourth grade, 91 percent across countries, on average, spoke the language of the test before starting school. However, the 9 percent who did not speak the language of the test before starting school had lower average science achievement on TIMSS 2011 (460 vs. 500). The results for the sixth grade and benchmarking students show that only about one-fourth (26%) of the students in Botswana spoke the language of the test before starting school, which is the lowest percentage among all entities that participated in the TIMSS 2011 fourth grade assessment.

In the TIMSS 2011 eighth grade assessment, students themselves reported on how often they speak the language of the test at home. As shown in Exhibit 4.6, for the eighth grade students, on average across countries, 79 percent always or almost always speak the language of the test at home, with 17 percent sometimes speaking it and 4 percent never speaking it. As with the fourth grade, average science achievement was higher for students who frequently speak the language of the test at home (481), compared to those who sometimes (448) or never (424) do so. Among the ninth grade participants, both Botswana and South Africa had very low percentages of students always or almost always speaking the language of the test at home (12% and 26%, respectively). These two countries had the lowest percentages of students speaking the language of the test at home, along with eighth grade participants Ghana (26%) and Tunisia (19%).

Parents' Educational Expectations for Their Children

Studies over the past several years have found a positive relationship between parental aspirations for their children and academic achievement. For example, researchers studying longitudinal effects in the United States found that more communication between parents and students as well as higher parents' aspirations resulted in higher student achievement (Hong & Ho, 2005). Across four ethnic groups, parents' educational aspiration was the most powerful predictor of increasing student educational aspiration; ultimately, the greater the student's own educational expectations, the greater the student's academic achievement.

Exhibit 4.7 presents parents' reports about their educational expectations for their children according to four education levels from highest to lowest: postgraduate degree, university degree, post-secondary, and upper secondary (or lower). Results are shown for countries that administered both TIMSS and PIRLS fourth grade assessments to the same fourth grade students. Across the TIMSS 2011 participants, parents have very high educational expectations for their children (to the extent that some parents may have misunderstood the question). Nearly one-third (30%) of the fourth grade students have parents who expect them to attain a postgraduate degree and another third (35%) are expected to graduate from university. Still, there was considerable variation in results across and within countries.

Consistent with other research, the results show a positive relationship between parents' aspirations and students' average science achievement. Across the fourth grade countries, students' average science achievement increased with each successively higher level of education expected by their parents, to the extent that there was a 81-point difference between students whose parents expected a postgraduate degree at one end of the continuum and those whose parents expected upper secondary school (or lower) at the other end of the continuum (524 vs. 443). The results for the sixth grade and benchmarking participants were similar to the results at the fourth grade.

* Available only for countries that administered both TIMSS and PIRLS to the same fourth grade students because this item was included in the PIRLS Home Questionnaire completed by parents.

** For example, doctorate, master's, or other postgraduate degree or diploma.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (–) indicates comparable data not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

Exhibit 4.8 presents students' reports of their educational aspirations from the TIMSS 2011 eighth grade assessment. As shown on the first page and similar to the parents of the fourth grade students, the eighth grade students had high expectations for further education, such that some students also may have misunderstood the question. However, looking at the countries that administered TIMSS and PIRLS to the same students at the fourth grade and also participated at the eighth grade, there was some degree of correspondence between the parents' responses and those by eighth grade students. Almost one-third (29%) of the eighth grade students expect to attain a postgraduate degree and more than one-fourth (27%) expect to graduate from university. Fifteen percent of the eighth grade students indicated that they did not know how far in school they would go.

The eighth grade results also show a positive relationship between educational aspirations (in this case those of the students themselves) and average science achievement. Across the eighth grade countries, the students at each higher level of education expectation had higher average science achievement than the level below. Students expecting a postgraduate degree had a 99-point advantage in average achievement compared to those expecting to go no further than upper secondary school, about a full standard deviation on the TIMSS achievement scale (513 vs. 412). The results for the ninth grade and benchmarking participants were similar to the results at the eighth grade.

Students Attended Preprimary Education

Preprimary education, in the form of preschool, kindergarten, or an early childhood education program, plays an important role in preparing children for primary school. For example, recent PIRLS assessments have found a positive relationship between years of preprimary education and reading achievement in the fourth grade. Also, recent analyses of longitudinal data in the United States and England found that preschool attendance was positively related to enhanced school performance, and that the duration of attendance was associated with greater academic improvement (Tucker-Drob, 2012; Sammons, et al., 2002). Besides giving students an early start in school and life, there are also broader reasons for countries to invest in preschool (Economist Intelligence Unit, 2012). For example, preprimary education provides an avenue for overcoming children's disadvantages and can help to break the generational repetitive cycle of poverty and low achievement.

Although there is considerable variation across countries, according to the *TIMSS 2011 Encyclopedia*, some countries already have mandatory preprimary education (e.g., Austria, Hungary, and the Netherlands), some have nearly 100 percent enrollment even though attendance is not mandatory (e.g., Australia, Croatia, and Singapore), and a number of the remaining countries are working to increase enrollment in preprimary education. Of course, school policies of entering primary school at older ages (e.g., age 7 in Finland, Lithuania, and Sweden) permit opportunities for more years of preschool attendance than when children start primary school at younger ages (e.g., age 4 or 5 in England, Ireland, the Netherlands, New Zealand, and Northern Ireland). Exhibit C.1 in Appendix C contains information across countries, about the different policies and practices about the age of entry to primary school.

Exhibit 4.9 presents the TIMSS 2011 parents' reports on the number of years their children participated in preprimary education for countries that administered both TIMSS and PIRLS to the same fourth grade students. In addition, for all participants in the fourth grade TIMSS 2011 assessment, the exhibit presents National Research Coordinators' reports of whether or not there was a national preprimary curriculum that includes science skills. It is noted that these preprimary curricula may involve only rudimentary observation and classification skills as well as perhaps experiencing some technology, yet two-thirds of the TIMSS 2011 fourth grade countries indicated that their preprimary curriculum made such provision, as did all of the benchmarking participants. None of the three sixth grade countries reported a preprimary curriculum that included science skills.

Although attendance in preprimary education differed dramatically from country to country, on average, 43 percent of the fourth grade students had at least three years of preprimary education and another 33 percent had less than three years but more than one year; eleven percent had only one year or less of preprimary education. Students with three years had higher average achievement (505) than their counterparts with less than three but more than one year (497) or one year or less of preprimary education (478). Most notably, however, the 13 percent of students, on average, that did not attend preschool had much lower average science achievement (454). There was a range across countries, but the majority of students did not attend preschool in Azerbaijan (64%) and Saudi Arabia (52%). Also, among the sixth grade participants, the majority of students in Botswana (56%) did not attend preprimary education.

Chapter 5

School Resources for Teaching Science

The most successful schools tend to have students that are relatively economically affluent and speak the language of instruction. Successful schools also are likely to have better working conditions and facilities as well as more instructional materials, such as books, computers, technological support, and supplies.

The learning environment of the school can be a positive influence, encouraging a positive attitude toward academic excellence and facilitating classroom instruction. Considerable research has shown that higher levels of school resources are associated with higher achievement. However, the relationship between resources and achievement is complicated. First, a school can have a more socioeconomically advantaged student population, for example, because of its location or because it competes for students. Second, the school system can invest more money into schools for such things as facilities, teachers' salaries, equipment, and materials. It follows that the most successful schools are likely to have more socioeconomically advantaged students and better resources.

Schools with Students from Advantaged Home Backgrounds

The home backgrounds of students attending a school can be closely related to the learning environment, with the two reinforcing each other and being strongly linked to academic achievement. Students from home backgrounds supportive of learning are likely to have more positive attitudes toward learning and, perhaps, even better discipline. Beyond that, parents that have high educational expectations for their children are more likely to take an active interest in the quality of teachers and school facilities.

School Location

Depending on each country's characteristics, a school's location can have a substantial impact on whether the students attending that school typically are from economically and educationally advantaged home backgrounds. Also, depending on the country, the location of the school can provide access to important additional resources (e.g., libraries, media centers, or museums) or mean that the school is relatively isolated.

To provide some information about the urbanicity of each school's location, TIMSS 2011 asked principals to describe the population size of the city, town, or area in which their schools were located. For the fourth grade science assessment, Exhibit 5.1 shows the percentages of students together with their average achievement for schools located in cities, towns, or areas of three different population sizes: cities of more than 100,000; cities or towns of 15,001 to 100,000; and small towns, villages, or rural areas of 15,000 or fewer people. Countries are presented in alphabetical order with the fourth grade on

the first page of the exhibit, followed by the sixth grade and the benchmarking participants on the second page.

On average, across the fourth grade countries, 31 percent of students attended schools in cities with more than 100,000 people, 27 percent attended schools in cities or towns of 15,001 to 100,000, and 42 percent in small towns, villages, or rural areas. In general, the fourth grade students attending schools in the largest cities had the highest average science achievement (497), followed by students in medium sized cities (484), and then those in smaller towns and rural areas (475). While this pattern held for the majority of the countries in the fourth grade assessment, there were also other patterns. In some countries, students attending schools in medium sized cities of 15,001 to 100,000 had higher average achievement than students in schools in larger cities, or there was not much difference in average achievement between the two. There were also a number of countries where average science achievement was highest among students attending schools in small towns or rural areas. The countries that assessed TIMSS 2011 in the sixth grade had relatively large percentages of students (64–77%) attending schools small towns or rural areas, and these students had lower average science achievement than students in schools in large or medium sized cities.

Exhibit 5.2 shows principals' reports about school location for the TIMSS 2011 eighth grade assessment, with percentages of students and average achievement for the eighth grade countries on the first page and results for the ninth grade and benchmarking participants on the second page. Compared to the fourth grade assessment, the results indicated a slight shift away from small towns and rural areas into large cities. For the eighth grade assessment, 37 percent of students were attending schools in cities with more than 100,000 people, 28 percent attended schools in cities or towns of 15,001 to 100,000, and 35 percent in small towns, villages, or rural areas. On average across countries, science achievement differences among students attending the three types of schools were somewhat more pronounced than at the fourth grade, with average achievement highest in the big-city schools (492), next highest in schools in medium sized cities (473), and lowest in schools in rural areas or small towns (463). As with the fourth grade, this pattern did not hold in all countries and there was considerable variation.

School Composition by Student Background

Ever since the Coleman report (Coleman, et al., 1966), researchers have recognized that the compositional characteristics of a school's student body can affect student achievement, and specifically that students from disadvantaged backgrounds typically have higher achievement if they attend schools in which the majority of students are from advantaged backgrounds. To provide information on this topic, TIMSS routinely asks school principals to report on two demographic characteristics of their schools:

- ◆ Economic home background; and
- ◆ Language home background.

Previous assessments have found both to be strongly related to average science achievement. For example, in TIMSS 2007 the science achievement of students attending schools with a higher proportion of economically advantaged students was higher than for those attending schools with large proportions of disadvantaged students. Also, science achievement was highest for students in schools where most students spoke the language of the TIMSS assessment as their first language, and was progressively lower as percentages of students not having the TIMSS language as their first language increased.

Exhibit 5.3 presents, for participants in the TIMSS 2011 fourth grade assessment, principals' economic categorizations of their schools according to three categories that are fully described on the second page of the exhibit. To summarize, the **More Affluent** schools had more than one-fourth of their students from affluent home backgrounds and not more than one-fourth from disadvantaged home backgrounds, and the **More Disadvantaged** schools had the reverse situation. The other schools were "in between." Across the fourth grade countries, students were distributed relatively equally across three types of schools. On average, across countries at the fourth grade, 36 percent of the students attended schools with relatively more affluent students than disadvantaged students, and students in these schools had the highest average achievement (505). At the other end of the range, 30 percent of the students attended schools with relatively more disadvantaged students than affluent students, and students in these schools had the lowest average achievement (463). Although this overall achievement pattern was observed in most countries and benchmarking participants, there was a wide variation among participants in the percentages of students attending the three different economic categories of schools.

Exhibit 5.4 presents the results for school composition by student economic background for participants in the TIMSS 2011 eighth grade assessment. Similar to the fourth grade assessment, internationally students were distributed relatively equally across three categories of schools, with 32 percent of the eighth grade students attending schools with relatively more affluent than disadvantaged students and 36 percent attending schools with relatively more disadvantaged than affluent students. Again, the percentages of students in each school category varied considerably across countries. Also similar to the fourth grade assessment, average science achievement was highest among the eighth grade students attending schools with relatively more affluent students than disadvantaged students (501), and lowest among students attending schools with relatively more disadvantaged students (458).

Exhibit 5.5 presents, for participants in the fourth grade assessment, principals' reports of the percentage of students in their schools who had the language of the TIMSS 2011 test as their native language. Approximately three-fourths of the fourth grade students (73%) were in schools where almost all students (more than 90%) spoke the language of the TIMSS test as their native language, 15 percent were in schools where the majority of students (51–90%) were native speakers of the TIMSS test language, and 13 percent were in schools where half the students (or less) spoke the language of the test as their native language. Among countries participating at the sixth grade, Botswana was notable for having almost all students (92%) in schools in which 50 percent or fewer of students had the language of the TIMSS test as their native language. On average across the fourth grade countries, science achievement was highest among students in schools where almost all students had the language of the TIMSS test as their native language (488). Achievement was next highest in schools where 51–90% of students had the language of the TIMSS test as their native language (477), and was lowest in schools where half the students or less had the language of the TIMSS test as their native language (457). Among countries participating at the sixth grade, Botswana was notable for having almost all students (92%) in schools with half or less native speakers.

Exhibit 5.6 presents, for participants in the eighth grade assessment, principals' reports of the percentage of students in their schools who had the language of the TIMSS 2011 test as their native language. Similar to the fourth grade results, across countries, the majority of eighth grade students (69%) were in schools where almost all students (more than 90%) spoke the language of the TIMSS test as their native language, 13 percent were in schools where the

majority of students (51–90%) were native speakers of the TIMSS test language, and 17 percent were in schools where half the students (or less) spoke the language of the test as their native language. For the eighth grade students, on average across countries, the relationship between language composition of the school and average science achievement also was similar to the fourth grade. Science achievement was highest among students in schools where almost all students had the language of the TIMSS test as their native language (483), next highest in schools where 51–90% of students had the language of the TIMSS test as their native language (478), and lowest in schools where 50 percent or fewer of the students had the language of the TIMSS test as their native language (466).

Schools with Sufficient Facilities, Books, and Technology

Studies have shown that resources are crucial for improving schooling, perhaps even more so in developing countries than in economically developed countries, where adequate school structures and material resources can be taken for granted (Lee & Zuze, 2011). The extent and quality of school resources can have an important impact on the quality of classroom instruction.

School Resources

TIMSS collects information on the extent to which school resources are available to support science instruction by asking school principals about the degree of shortages or inadequacies in general school resources (materials, supplies, heating/cooling/lighting, buildings, space, staff, and computers) as well as about resources specifically targeted to support science instruction (specialized teachers, science equipment and materials, computer software, library materials, audio-visual resources, and calculators). Although “adequacy” can be relative, in each previous TIMSS assessment there has been a strong positive relationship between principals’ perceptions of the absence of school resource shortages and average science achievement.

Exhibit 5.7 presents the results for the Science Resources Shortages scale for participants in the TIMSS 2011 fourth grade assessment. Students were scored according to their principals’ responses concerning twelve school and classroom resources (see the second page of the exhibit for details). Countries are ordered according to the percentage of students (from most to least) in schools **Not Affected** by resource shortages. Schools in this category had principals who reported that shortages affected instruction “not at all” for six of the twelve resources and only “a little” for the other six, on average. There was

substantial variation across the fourth grade countries—from 0 to 63 percent, with an average of 22 percent of students attending well-resourced schools.

Students in schools where instruction was **Affected A Lot** had principals who reported that shortages affected instruction “a lot” for six of the twelve resources and “some” for the other six, on average. All other students attended schools where instruction was **Somewhat Affected** by resource shortages. Countries are ordered according to the percentage of students (from highest to lowest) in schools **Not Affected** by resource shortages. Only two countries (Korea and Slovenia) had more than 50 percent of their students in schools **Not Affected** by resource shortages; a large majority of countries and benchmarking participants had more than 50 percent of their students in schools that were **Somewhat Affected** by resource shortages. Only eight of the 50 fourth grade countries and one benchmarking participant had more than 15 percent of their students in schools that were **Affected a Lot**. On average across countries, students in schools that were **Affected a Lot** by science resource shortages had lower science achievement (460 points) than students in schools that were **Not Affected** (495) or **Somewhat Affected** (485).

Exhibit 5.8 presents the results for the Science Resource Shortages scale for participants in the TIMSS 2011 eighth grade assessment. As shown on the second page of the exhibit, the eighth grade scale was based on principals’ responses concerning 13 school and classroom resources. The results were similar to the fourth grade results, with wide variation across countries in the percentage of eighth grade students attending schools that were **Not Affected** by resource shortages (1–64%), and only three countries having more than 50 percent of their students in such schools (Singapore, Slovenia, and Korea). Again, a large majority of countries and benchmarking participants had more than 50 percent of their students in schools that were **Somewhat Affected** by resource shortages, and only four of the 42 eighth grade countries and one benchmarking participant had more than 15 percent of their students in schools that were **Affected a Lot**. Also as at fourth grade, on average across countries, students in schools that were **Affected a Lot** by science resource shortages had lower science achievement (464) than students in schools that were **Not Affected** (494) or **Somewhat Affected** (474).

Exhibit 5.7: Instruction Affected by Science Resource Shortages

Reported by Principals

Students were scored according to their principals' responses concerning twelve school and classroom resources on the *Science Resource Shortages* scale. Students in schools where instruction was **Not Affected** by resource shortages had a score on the scale of at least 11.3, which corresponds to their principals reporting that shortages affected instruction "not at all" for six of the twelve resources and "a little" for the other six, on average. Students in schools where instruction was **Affected A Lot** had a score no higher than 7.1, which corresponds to their principals reporting that shortages affected instruction "a lot" for six of the twelve resources and "some" for the other six, on average. All other students attended schools where instruction was **Somewhat Affected** by resource shortages.

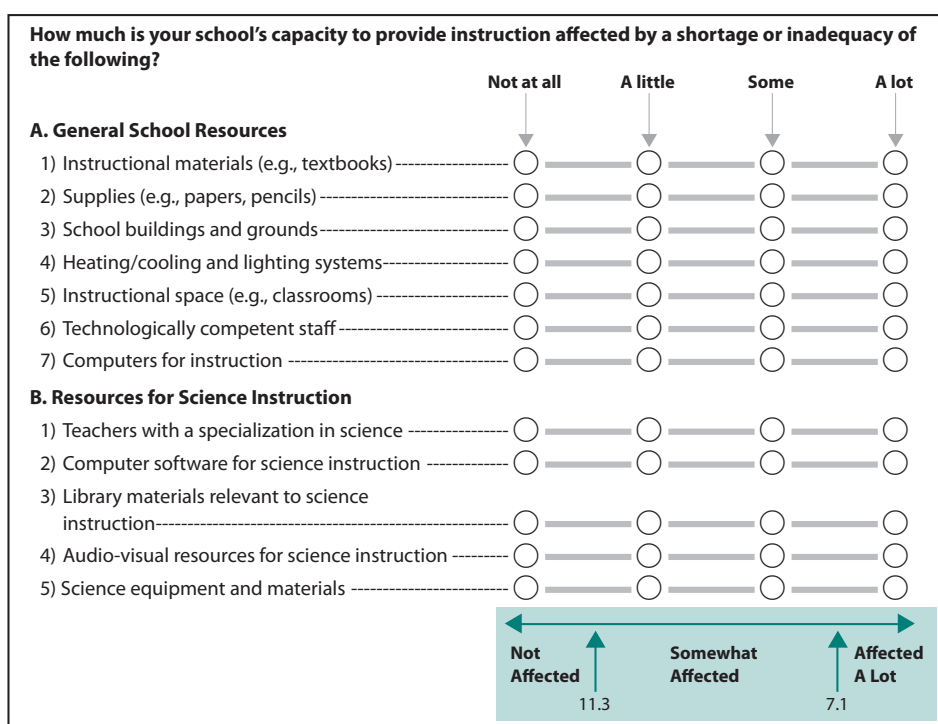

Exhibit 5.8: Instruction Affected by Science Resource Shortages

Reported by Principals

Students were scored according to their principals' responses concerning thirteen school and classroom resources on the *Science Resource Shortages* scale. Students in schools where instruction was **Not Affected** by resource shortages had a score on the scale of at least 11.2, which corresponds to their principals reporting that shortages affected instruction "not at all" for seven of the thirteen resources and "a little" for the other six, on average. Students in schools where instruction was **Affected A Lot** had a score no higher than 7.3, which corresponds to their principals reporting that shortages affected instruction "a lot" for seven of the thirteen resources and "some" for the other six, on average. All other students attended schools where instruction was **Somewhat Affected** by resource shortages.

← Not Affected Somewhat Affected Affected A Lot →

11.2 7.3

Teacher Working Conditions

There is evidence that, in some countries, teacher shortages may exist partly as a result of poor working conditions. For example, a review of research from the United States suggests that teachers who leave the profession after just a few years are more likely to leave because of poor working conditions than because of low pay (Johnson, 2006). Although teachers' reports across countries are related to their expectations and need to be considered in the context of variations in economic situations, TIMSS 2011 asked the students' teachers to provide their views on the adequacy of their working conditions. More specifically, teachers were asked about five potential problem areas:

- ◆ The school building needing significant repair;
- ◆ Classrooms being overcrowded;
- ◆ Teachers having too many teaching hours;
- ◆ Teachers not having adequate workspace; and
- ◆ Teachers not having adequate instructional materials and supplies.

Exhibit 5.9 presents the results for the TIMSS 2011 fourth grade assessment for the Teacher Working Conditions scale (see the second page of the exhibit for details about the scale). Countries are ordered by the percentage of students whose teachers reported few problems with their working conditions. Teachers with **Hardly Any Problems** with their working conditions reported “not a problem” for three of the five areas and only “minor problems” for the other two, on average. There was a range of results across the fourth grade countries—from 5 to 51 percent, with about one-fourth of students in schools where teachers had **Hardly Any Problems**.

For this scale, the remaining two categories were **Minor Problems** and **Moderate Problems**. Teachers with **Moderate Problems** reported “moderate problem” for three of five conditions and “minor problem” for the other two, on average. All other students had teachers that reported **Minor Problems** with their working conditions. About half of the students, on average, across the fourth grade countries were in schools where teachers had **Minor Problems** and about one-fourth were in schools with **Moderate Problems**. Students whose teachers reported **Moderate Problems** had somewhat lower science achievement, on average, than those whose teachers reported **Minor Problems**, and those students in turn had lower achievement than students whose teachers reported **Hardly Any Problems** (481, 487, and 494, respectively). In general,

the results for the sixth grade and benchmarking participants followed a similar pattern. However, substantial percentages of students (ranging from 45–56%) in the sixth grade countries had teachers reporting moderate problems with school conditions.

Exhibit 5.10 presents the results for the Teacher Working Conditions scale for the TIMSS 2011 eighth grade assessment. The eighth grade scale was based on responses by the students' science teachers to statements about the same five problem areas as the fourth grade. Eighth grade science teachers expressed about the same level of satisfaction with working conditions as fourth grade teachers, with 20 percent of students in schools whose teachers reported **Hardly Any Problems** and 32 percent in schools with **Moderate Problems**. On average across countries, the science achievement difference between these two groups of students was 16 points (489 vs. 473).

Difficulties Filling Vacancies for Science Teachers

Recent research suggests that teachers are in relatively short supply in some countries, and that the impending retirement of aging teachers will further contribute to this shortage (Ingersoll & Perda, 2010). TIMSS Advanced 2008 noted that, in several countries, not only were teachers of physics nearing retirement age, but relatively few students were considering physics as a career option, suggesting that there also may be a shortage of students entering science education careers (Mullis, Martin, Robitaille, & Foy, 2009).

Exhibit 5.11 summarizes school principals' reports from the TIMSS 2011 eighth grade assessment about difficulties in filling vacancies for science teachers. In most countries, on average, eighth grade students were in schools where principals reported that there were no vacancies (56%) or that vacancies were easy to fill (25%). Average science achievement was similar for these two groups of students (477 and 479, respectively). However, average achievement was somewhat lower among the 15 percent of students in schools where vacancies were somewhat difficult to fill (468) and among the 4 percent in schools where vacancies were very difficult to fill (459).

Exhibit 5.9: Teacher Working Conditions

Reported by Teachers

Students were scored according to their teachers' responses concerning five potential problem areas on the *Teacher Working Conditions* scale. Students whose teachers had **Hardly Any Problems** with their working conditions had a score on the scale of at least 11.3, which corresponds to their teachers reporting "not a problem" for three of five areas and "minor problem" for the other two, on average. Students whose teachers had **Moderate Problems** had a score no higher than 8.7, which corresponds to their teachers reporting "moderate problem" for three of five conditions and "minor problem" for the other two, on average. All other students had teachers that reported **Minor Problems** with their working conditions.

In your current school, how severe is each problem?

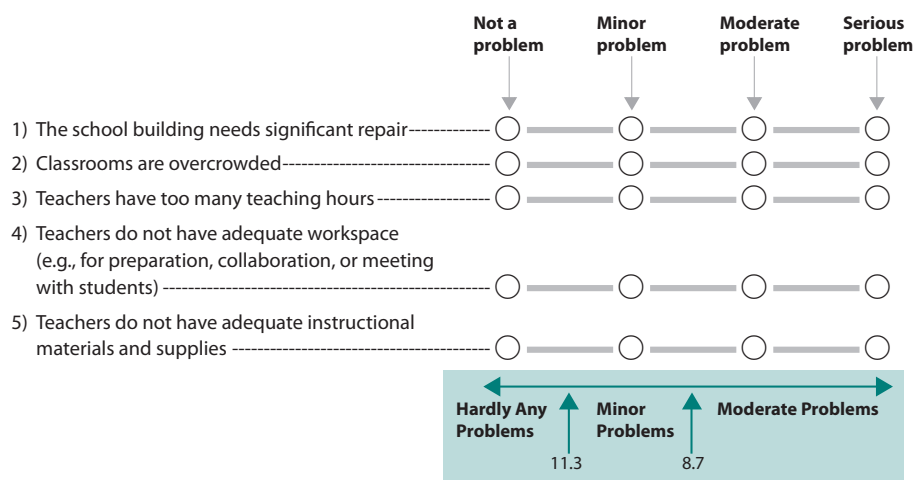

Exhibit 5.10: Teacher Working Conditions

Reported by Teachers

Students were scored according to their teachers' responses concerning five potential problem areas on the *Teacher Working Conditions* scale. Students whose teachers had **Hardly Any Problems** with their working conditions had a score on the scale of at least 11.7, which corresponds to their teachers reporting "not a problem" for three of five areas and "minor problem" for the other two, on average. Students whose teachers had **Moderate Problems** had a score no higher than 8.9, which corresponds to their teachers reporting "moderate problem" for three of five conditions and "minor problem" for the other two, on average. All other students had teachers that reported **Minor Problems** with their working conditions.

Size of School Library

Libraries, both within schools and local communities, provide a range of reading materials and other resources from which teachers can draw to expand their instructional approaches, and from which students can choose books for their own learning and enjoyment. Also, with growing technology use, libraries increasingly are becoming media centers offering Internet access to a wide range of materials, with the potential to improve achievement in all areas, including science.

Exhibit 5.12 presents principals' reports about the existence and size of school libraries for participants in the TIMSS 2011 fourth grade assessment. In considering these results, it is important to realize that, because of variation in policies across countries regarding school libraries and classroom libraries, some countries have well-resourced classroom libraries rather than a larger central library, so the lack of a school library does not necessarily mean that children do not have access to a variety of books. Also, primary schools tend to be smaller than middle and secondary schools, and may have small libraries as a result of their small enrollments.

On average, across the fourth grade countries, 32 percent of the students attended schools (for the most part primary schools) having well-resourced school libraries with more than 5,000 book titles. Another 38 percent of the students attended schools having libraries with between 501 and 5,000 book titles, and 17 percent attended schools having smaller library collections of 500 book titles or fewer. On average internationally, 13 percent of fourth grade students attended schools with no school library.

Average science achievement was positively related to size of school library, with fourth grade students attending schools with well-resourced school libraries having the highest achievement (505) and students with no school library the lowest achievement (472). In the sixth grade countries, there were few students in schools with libraries having more than 5,000 book titles, and high percentages of students (50% or greater) with no school library.

Schools with Computers Available for Instruction

Recent research reviews suggest that computer use continues to grow in mathematics and science instruction, and that it can positively effect students' mathematics and science achievement. For example, a review of evaluation studies of computer use in US primary and secondary schools since 1990 found that computer tutorials in natural and social science classes have a strong record of effectiveness, and that simulation programs sometimes improve the effectiveness of science teaching, although the evidence is less definitive (Kulik, 2003).

Exhibit 5.13 shows principals' reports about the availability of computers for instruction for participants in the TIMSS fourth grade assessment. Internationally, 38 percent of the fourth grade students, on average, were in schools that had 1 computer for every 1–2 fourth grade students, 30 percent were in schools with 1 computer for every 3–5 fourth grade students, and 24 percent were in schools with 1 computer for 6 or more students. There was considerable variation from country to country, with the highest computer-to-student ratio in England (90% of students in schools with 1 computer for every 1–2 fourth grade students) and the lowest in Iran, Tunisia, and Yemen (7% or fewer students in such schools). On average, however, only 8 percent of the fourth grade students were in schools that did not have any computers available for instruction. The percentages of students in schools with no computers for instruction were higher for the sixth grade participants.

The relationship between computer availability and average science achievement is difficult to interpret because it is highly interrelated with socio-economic levels and instructional practices. In the primary grades, computer instruction can be used for remedial purposes as frequently (if not more frequently) because it can provide an increased variety of stimulating and challenging activities. However, the fourth grade students with access to computers for instruction had higher average science achievement than those students with no access to computers for instruction.

Exhibit 5.14 provides principals' reports about the availability of computers for instruction for participants in the TIMSS eighth grade assessment. Levels of computer availability are similar to the fourth grade (although a little more favorable), with 40 percent of the eighth grade students, on average, in schools that had 1 computer for every 1–2 eighth grade students, 28 percent in schools with 1 computer for every 3–5 eighth grade students, and 28 percent in schools with 1 computer for 6 or more students. Only 4 percent of the eighth grade students were in schools with no provision for computers for instruction. Eighth grade participants with 70 percent or more of students in schools with the highest computer-to-student ratio (1 computer for every 1–2 eighth grade students) included Australia, England, Georgia, Hungary, Macedonia, New Zealand, Norway, Slovenia, and, among benchmarking participants, Alberta, Colorado, and Indiana. Similar to the fourth grade, there was little relationship between computer-to-student ratio and science achievement, although average achievement was lower for the 4 percent of students in schools with no computers available for instruction.

Does your school have a school library?

- 1) Yes
- 2) No

If Yes,

A. Approximately how many books with different titles does your school library have (exclude magazines and periodicals)?

- 1) 250 or fewer
- 2) 251–500
- 3) 501–2,000
- 4) 2,001–5,000
- 5) 5,001–10,000
- 6) More than 10,000

Exhibit 5.13: Schools with Computers Available for Instruction

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

The number of students per computer was calculated by dividing the number of students by the number of computers.

- 1) **What is the total enrollment of fourth grade students in your school as of the first day of the month TIMSS 2011 testing begins?**

- 2) **What is the total number of computers that can be used for instructional purposes by fourth grade students?**

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

The number of students per computer was calculated by dividing the number of students by the number of computers.

1) **What is the total enrollment of eighth grade students in your school as of the first day of the month TIMSS 2011 testing begins?**

2) **What is the total number of computers that can be used for instructional purposes by eighth grade students?**

Schools with Science Laboratories

Undertaking “hands-on” science investigations is an important component of science curricula in many countries. TIMSS 2011 collected information on the availability of science laboratories at the fourth and eighth grades, and the availability of instructional assistance when students are conducting experiments (at eighth grade only). Exhibit 5.15 presents results for principals’ reports of the availability of science laboratories among participants in the fourth grade assessment. Across fourth grade countries, 36 percent of students attended schools with a science laboratory, but among countries this percentage ranged from 0 percent (Ireland, Lithuania, and Northern Ireland) to 100 percent (Korea, Kuwait, and Singapore). On average across countries, students attending schools with a science laboratory had somewhat higher achievement (489) than students attending schools with no laboratory (483).

Exhibit 5.16 presents results for principals' reports of the availability of science laboratories and of assistance for teachers when students are conducting science experiments for participants in the eighth grade assessment. Across the eighth grade countries, a much higher percentage of students attended schools with science laboratories (80%) than at the fourth grade. In 29 of the 42 countries, more than 80 percent of students attended schools that had a science laboratory, and in only two countries (Lithuania and Ghana) was the percentage of students in schools with a laboratory less than 35 percent (13% and 2%, respectively). On average across countries, student science achievement in schools with laboratories was higher (485) than that of students at schools with no laboratories (451); this achievement difference also occurred within many countries. Across the eighth grade countries, 57 percent of students attended schools in which teachers had assistance when students were conducting science experiments, but among countries this percentage ranged from 9 percent (Chile and Italy) to 99 percent (Hong Kong SAR). On average across countries, the eighth grade students attending schools in which teachers had assistance had higher achievement (480) than students attending schools in which teachers did not have assistance (472).

Chapter 6

School Climate

Students with the highest science achievement typically attend schools that emphasize academic success, as indicated by rigorous curricular goals, effective teachers, students that desire to do well, and parental support. In contrast, schools with discipline and safety problems are not conducive to high achievement. Students that attended schools with disorderly environments and reported more frequent bullying had much lower achievement than their counterparts in safe and orderly schools.

The school's educational values are reflected by the teachers, school leadership, the students themselves, and their parents. A school with a positive atmosphere toward high achievement and a rigorous academic program can overcome resource shortages and encourage students toward excellent performance. By contrast, the environment in a school with disciplinary problems is not conducive to higher student achievement. When students are fearful and worried about their safety, for example, it is difficult to focus on academics. Chapter 6 presents the TIMSS 2011 results about positive and negative aspects of the atmosphere in schools around the world.

Schools Emphasize Academic Success

Studies of academic optimism show that a positive school atmosphere emphasizing academic achievement can even overcome socioeconomic disadvantages (McGuigan & Hoy, 2006). There are several dimensions of academic optimism, including the communication of a school's academic emphasis through clear and rigorous academic goals. The effect on achievement is greatest when there is a collective influence, including a school administration and teachers that support and trust in students' capability to achieve. In addition to making it clear that academic success is important, principals and teachers must emphasize that it can be achieved. Parents' support for their children's learning also contributes to a school's collective efficacy and the belief that the school's academic goals can be implemented.

School Emphasis on Academic Success

The TIMSS 2011 School Emphasis on Academic Success scale characterizes five aspects of academic optimism:

- ◆ Teachers' understanding of the school's curricular goals;
- ◆ Teachers' degree of success in implementing the school's curriculum;
- ◆ Teachers' expectations for student achievement;
- ◆ Parental support for student achievement; and
- ◆ Students' desire to do well in school.

Information was collected from both students' principals and teachers, with the respective responses used to create scales.

Exhibit 6.1 shows the principals' reports on the School Emphasis on Academic Success scale for the TIMSS 2011 fourth grade assessment. As might be anticipated, principals had very positive attitudes about the emphasis on

academics in their schools, so the three regions of the scale have been described as **Very High**, **High**, and **Medium**. Students were scored according to their principals' characterization of their school in terms of the five aspects. Students in schools with **Very High Emphasis** on academic success had principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in **Medium Emphasis** schools had principals characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a **High Emphasis** on academic success.

On average, across the fourth grade countries, 8 percent of the students attended schools where the principal reported a **Very High Emphasis** on academic success, 58 percent attended schools with a **High Emphasis**, and 34 percent attended a school with a **Medium Emphasis**. However, there was considerable variation across countries, with as few as 28 percent of students, and as many as 99 percent of students, attending schools with a very high or high emphasis on academic success. On average across fourth grade countries, there was a distinct direct correspondence between average science achievement and principals' reports, with higher emphasis on academic success related to higher average science achievement. The results were similar for most of the sixth grade countries and benchmarking participants.

Exhibit 6.2 shows the principals' reports on the School Emphasis on Academic Success scale for the TIMSS 2011 eighth grade assessment. Although similar to the fourth grade results, principals of the eighth grade schools reported slightly less emphasis on academic success, with 7 percent of the students attending a school where the principal reported a **Very High Emphasis** on academic success, 53 percent a school with a **High Emphasis**, and 41 percent a school with a **Medium Emphasis** (compared to 8%, 58%, and 34%, respectively, at the fourth grade). Similar to the fourth grade, there was considerable variation across countries, from as little 19 percent to as much as 93 percent of students attending schools with a very high or high emphasis on academic success. At the eighth grade, there was also a somewhat greater difference in average science achievement (44 points) between students attending **Very High Emphasis** schools (504) and students attending **Medium Emphasis** schools (460); this difference was 37 points at the fourth grade (508 vs. 471 for **Very High Emphasis** and **Medium Emphasis** schools, respectively).

Exhibits 6.3 and 6.4 show the teachers' reports on the School Emphasis on Academic Success scale for the fourth and eighth grade assessments,

Exhibit 6.1: School Emphasis on Academic Success - Principal Reports

Reported by Principals

Students were scored according to their principals' responses characterizing five aspects on the *School Emphasis on Academic Success* scale. Students in schools where their principals reported a **Very High Emphasis** on academic success had a score on the scale of at least 13.1, which corresponds to their principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a **Medium Emphasis** on academic success had a score no higher than 8.9, which corresponds to their principals characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a **High Emphasis** on academic success.

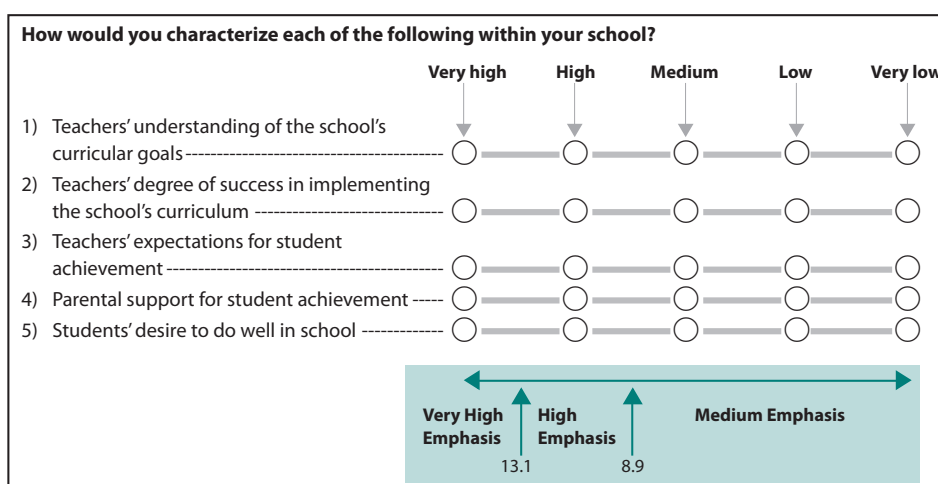

Exhibit 6.2: School Emphasis on Academic Success - Principal Reports

Reported by Principals

Students were scored according to their principals' responses characterizing five aspects on the *School Emphasis on Academic Success* scale. Students in schools where their principals reported **Very High Emphasis** on academic success had a score on the scale of at least 13.3, which corresponds to their principals characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a **Medium Emphasis** on academic success had a score no higher than 9.2, which corresponds to their principals characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a **High Emphasis** on academic success.

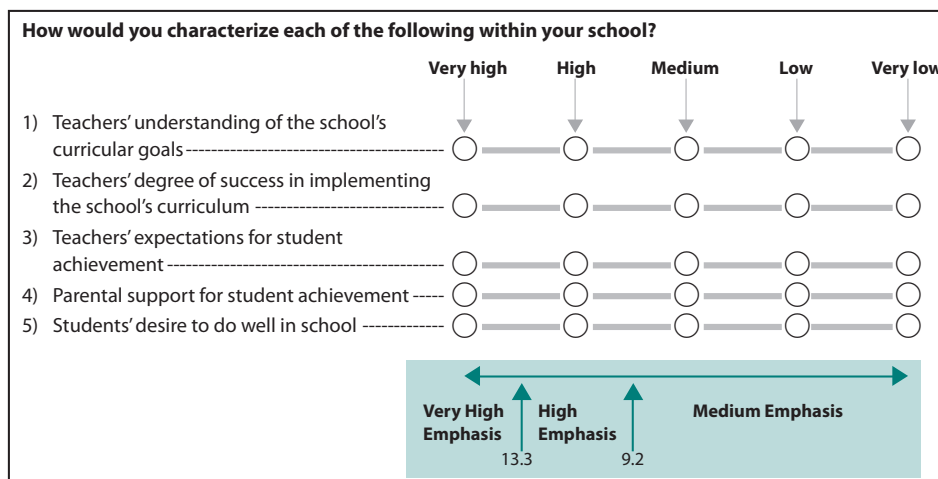

Exhibit 6.3: School Emphasis on Academic Success - Teacher Reports

Reported by Teachers

Students were scored according to their teachers' responses characterizing five aspects on the *School Emphasis on Academic Success* scale. Students in schools where their teachers reported a **Very High Emphasis** on academic success had a score on the scale of at least 13.1, which corresponds to their teachers characterizing three of the five aspects as "very high" and the other two as "high," on average. Students in schools with a **Medium Emphasis** on academic success had a score no higher than 8.8, which corresponds to their teachers characterizing three of the five aspects as "medium" and the other two as "high," on average. All other students attended schools with a **High Emphasis** on academic success.

respectively. The teachers' reports were similar to those of the principals for both assessments. On average across countries, with each reported decrease in academic emphasis, the students had progressively lower average science achievement. Similar to the results from principals' reports, the eighth grade students had science teachers who reported slightly less emphasis on academic success than did the fourth grade students' teachers, but the achievement gap between students in **Very High Emphasis** and **Medium Emphasis** schools was greater at the eighth grade (41 points) than at the fourth grade (27 points).

Principals Spend Time on Leadership Activities

The effectiveness of school leadership has become a central issue in education, and principals worldwide are held increasingly accountable for their students' achievement outcomes. However, the effects of principal leadership are often indirect and difficult to measure. A meta-analysis of multinational studies conducted between 1986 and 1996 found that "defining and communicating the school's mission" had the largest direct effect on student achievement (Witziers, Bosker, & Kruger, 2003), whereas a different meta-analysis of 27 studies conducted between 1978 and 2006 found strong effects for promoting teacher learning and development, and establishing goals (Robinson, Lloyd, & Rowe, 2008).

TIMSS 2011 used research conducted in the Netherlands (ten Bruggencate, Luyten, Scheerens, & Slegers, 2012) to develop questions about principals' leadership styles. In both the fourth and eighth grade assessments, principals were presented a list of nine leadership activities and asked to indicate on which activities they spent "a lot of time."

Exhibit 6.5 presents principals' reports from the fourth grade assessment about the various activities on which they spend "a lot of time." The pattern of varying reports from country to country can be observed among the fourth grade countries, sixth grade countries, and benchmarking participants. The first four activities about which principals were asked focused on school educational goals. On average across fourth grade countries, more than half of the students were in schools where promoting educational goals and developing educational goals occupied "a lot" of the principal's time (59% and 60%, respectively). Also, more than half of the fourth grade students had principals who spent "a lot of time" monitoring whether teachers implemented educational goals and monitoring students' progress to ensure goals are reached (53% and 57%, respectively). Principals also were asked about maintaining school discipline.

Over two-thirds of students (68%) were in schools in which the principal spent “a lot of time” keeping an orderly atmosphere in the school and 44 percent had principals that spent “a lot of time” addressing disruptive student behavior. Exhibit 6.5 also shows that three other leadership activities were reported less frequently as occupying “a lot” of principals’ time: advising teachers, initiating projects or improvements, and participating in professional development for principals.

Exhibit 6.6 summarizes principals’ reports from the eighth grade assessment about time spent on leadership activities. As at the fourth grade, reports vary considerably from country to country; however, summary results indicate that about two-thirds of the eighth grade students were in schools where the principal reported spending “a lot of time” promoting and developing the school’s educational goals and monitoring whether those goals were implemented by teachers and achieved by students. Three-fourths of the eighth grade students were in schools where the principal devoted “a lot of time” to keeping an orderly atmosphere and more than half had principals that spent “a lot of time” addressing disruptive student behavior. Similar to the fourth grade, the last three areas—advising teachers, initiating projects or improvements, and participating in professional development for principals—less frequently occupy “a lot” of the principal’s time.

Exhibit 6.5: Principals Spend Time on Leadership Activities

Reported by Principals

Schools with Discipline and Safety Problems

The sense of security that comes from attending a school with few behavior problems and having little or no concern about student or teacher safety promotes a stable learning environment. There is increasing research showing that a safe school environment is important for students' academic achievement. On the other hand, a general lack of discipline, especially if students and teachers are afraid for their safety, does not facilitate learning. Unfortunately, community and school violence are becoming an increasing problem, especially among urban youth.

Safe and Orderly School

There is growing evidence that students' perceived school safety adversely affects academic performance, even for primary school children (Milam, Furr-Holden, & Leaf, 2010). It seems that safety at school can no longer be taken for granted, even at the fourth grade. TIMSS 2011 developed the Safe and Orderly School scale to provide information on the extent to which school safety might be related to science achievement. In both the fourth and eighth grade assessments, students' teachers were asked about the degree to which they agreed or disagreed with five statements:

- ◆ This school is located in a safe neighborhood;
- ◆ I feel safe at this school;
- ◆ This school's security policies and practices are sufficient;
- ◆ The students behave in an orderly manner; and
- ◆ The students are respectful of the teachers.

Exhibit 6.7 presents the results for the Safe and Orderly School scale for the fourth grade assessment. Students were scored according to their teachers' degree of agreement with the five statements. Students in **Safe and Orderly** schools had teachers that "agreed a lot" with three of the five qualities and "agreed a little" with the other two, on average. Students in **Not Safe and Orderly** schools had teachers that "disagreed a little" with three of the five statements and "agreed a little" with the other two, on average. All other students attended **Somewhat Safe and Orderly** schools. There was substantial variation across countries, but on average across the fourth grade countries, the majority of students (53%) were attending **Safe and Orderly** schools. Almost all of the remaining students (43%) were in schools judged to be **Somewhat Safe and Orderly**. Only a small percentage of students (4%, on average) were in schools

judged **Not Safe and Orderly**. On average across the fourth grade countries, the safer the school as reported by their teachers, the higher the students' average science achievement, with a 44-point difference between the average achievement of students at **Safe and Orderly** schools and that of students at **Not Safe and Orderly** schools (493 vs. 449).

Exhibit 6.8 presents the corresponding Safe and Orderly School scale results for the eighth grade assessment. Students were assigned to one of the three school orderliness categories using the same criteria as at the fourth grade, and with broadly similar results. Although almost all eighth grade students, on average internationally, were in **Safe and Orderly** or **Somewhat Safe and Orderly** schools, the eighth grade science teachers were noticeably less positive in their reports. On average across the eighth grade countries, 45 percent of students (compared to 53% at fourth grade) were attending schools judged by their teachers to be **Safe and Orderly**, 50 percent of students (compared to 43%) were in schools judged to be **Somewhat Safe and Orderly**, and 6 percent of students (compared to 4%) were in schools judged **Not Safe and Orderly**. Similar to the fourth grade, on average across the eighth grade countries, the safer the school as reported by their teachers, the higher the students' average science achievement; however, the 31-point difference between the achievement of students in **Safe and Orderly** schools (488) and that of students in **Not Safe and Orderly** Schools (457) was less than at fourth grade.

School Discipline and Safety

Previous TIMSS assessments have asked principals for their perceptions about the degree to which a series of discipline, disorderly, and bullying behaviors are problems in their schools, and found that having fewer problems was related to higher average achievement. Exhibit 6.9 presents the TIMSS 2011 results for the fourth grade School Discipline and Safety scale. The scale was based on principals' responses about the extent to which ten different discipline and safety problems existed at their school (see the second page of the exhibit for a complete list of problems). Countries are ordered by the percentage of students whose principals reported few student discipline and school safety problems. Principals in schools with **Hardly Any Problems** with discipline or safety reported "not a problem" for five of the ten problems and only "minor problem" for the other five, on average. Principals in schools with **Moderate Problems** reported "moderate problem" for five of the ten issues and "minor problem" for the other five, on average. All other students attended schools with **Minor Problems**.

Exhibit 6.7: Safe and Orderly School

Reported by Teachers

Students were scored according to their teachers' degree of agreement with five statements on the *Safe and Orderly School* scale. Students in **Safe and Orderly** schools had a score on the scale of at least 10.2, which corresponds to their teachers "agreeing a lot" with three of the five qualities of a safe and orderly school and "agreeing a little" with the other two, on average. Students in **Not Safe and Orderly** schools had a score no higher than 6.3, which corresponds to their teachers "disagreeing a little" with three of the five qualities and "agreeing a little" with the other two, on average. All other students attended **Somewhat Safe and Orderly** schools.

Exhibit 6.8: Safe and Orderly School

Reported by Teachers

Students were scored according to their teachers' degree of agreement with five statements on the *Safe and Orderly School* scale. Students in **Safe and Orderly** schools had a score on the scale of at least 10.7, which corresponds to their teachers "agreeing a lot" with three of the five qualities of a safe and orderly school and "agreeing a little" with the other two, on average. Students in **Not Safe and Orderly** schools had a score no higher than 6.8, which corresponds to their teachers "disagreeing a little" with three of the five qualities and "agreeing a little" with the other two, on average. All other students attended **Somewhat Safe and Orderly** schools.

Exhibit 6.9: School Discipline and Safety

Reported by Principals

Students were scored according to their principals' responses concerning ten potential school problems on the *School Discipline and Safety* scale. Students in schools with **Hardly Any Problems** had a score on the scale of at least 9.7, which corresponds to their principals reporting "not a problem" for five of the ten discipline and safety issues and "minor problem" for the other five, on average. Students in schools with **Moderate Problems** had a score no higher than 7.6, which corresponds to their principals reporting "moderate problem" for five of the ten issues and "minor problem" for the other five, on average. All other students attended schools with **Minor Problems**.

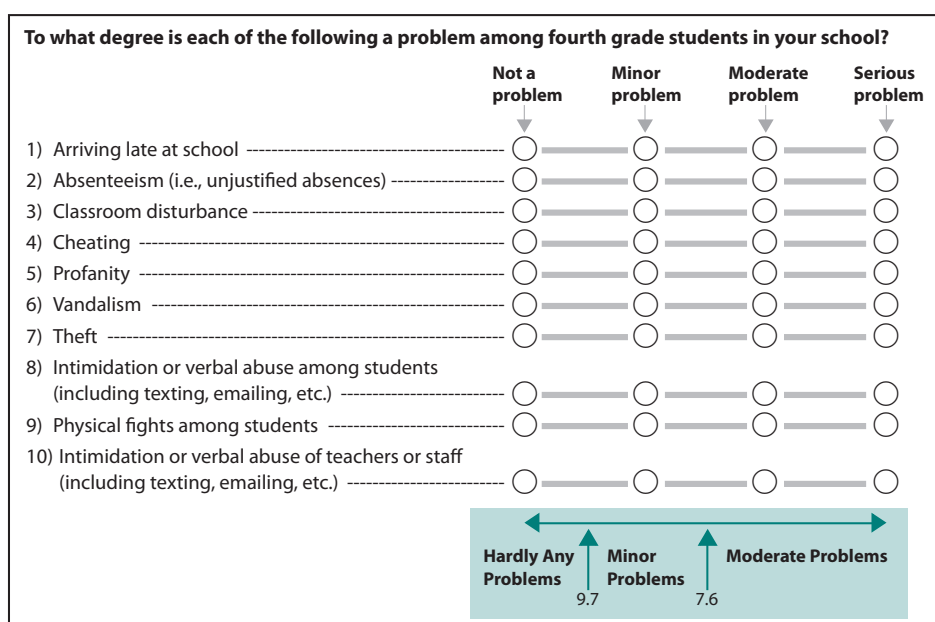

Exhibit 6.10: School Discipline and Safety

Reported by Principals

Students were scored according to their principals' responses concerning eleven potential school problems on the *School Discipline and Safety* scale. Students in schools with **Hardly Any Problems** had a score on the scale of at least 12.0, which corresponds to their principals reporting "not a problem" for six of the eleven discipline and safety issues and "minor problem" for the other five, on average. Students in schools with **Moderate Problems** had a score no higher than 8.4, which corresponds to their principals reporting "moderate problem" for six of the eleven issues and "minor problem" for the other five, on average. All other students attended schools with **Minor Problems**.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

On average across fourth grade countries, more than half of the students (61%) attended schools in which principals reported **Hardly Any Problems** with discipline and safety and 29 percent attended schools in which principals reported **Minor Problems**. Only 11 percent attended schools in which principals reported **Moderate Problems**. Students whose principals reported **Moderate Problems** had substantially lower science achievement, by 44 points on average, than students whose principals reported **Hardly Any Problems** (448 vs. 492). The results for the sixth grade countries and benchmarking participants followed a similar pattern.

Exhibit 6.10 presents the results for the School Discipline and Safety scale for the TIMSS 2011 eighth grade assessment. This scale is based on eleven discipline and school safety problems, ten of which comprised the fourth grade scale plus one additional problem more suited to older students—“Physical injury to teachers or staff” (see the second page of the exhibit for a complete list of the problems). Compared to the fourth grade, many fewer eighth grade students attend schools in which principals reported **Hardly Any Problems** (16% vs. 61%) and more attended schools in which principals reported **Minor Problems** (66% vs. 29%) or **Moderate Problems** (18% vs. 11%). Further examination of the principals’ reports of each of the discipline and safety problems indicates that the increase in the percentage of students attending schools with **Moderate Problems** and **Minor Problems** is largely because eight of these problems (classroom disturbance, cheating, profanity, vandalism, theft, intimidation or verbal abuse among students, students fighting, and intimidation or verbal abuse of teachers) often were “not a problem” at the fourth grade schools but were more often a “minor problem” at the eighth grade schools. Similar to fourth grade, the eighth grade students whose principals reported **Moderate Problems** in their schools had substantially lower science achievement, by 40 points on average, than those students whose principals reported **Hardly Any Problems**. The results for the ninth grade countries and benchmarking participants followed a similar pattern.

Students Bullied at School

Bullying typically involves aggression or negative behavior intended to harm or bother less physically or psychologically powerful persons, although a New Zealand review of the literature found a range of definitions and terminology relating bullying to violence and abuse (Carroll-Lind, 2009). There is growing

evidence that bullying in schools is on the rise, especially with the emergence of cyber-bullying, and that bullying does have a negative impact on students' educational achievement. To provide data about bullying in the participating countries, TIMSS 2011 created the Students Bullied at School scale, based on how often students experienced six bullying behaviors:

- ◆ I was made fun of or called names;
- ◆ I was left out of games or activities by other students;
- ◆ Someone spread lies about me;
- ◆ Something was stolen from me;
- ◆ I was hit or hurt by other student(s); and
- ◆ I was made to do things I didn't want to do by other students.

Exhibit 6.11 provides the results for the Students Bullied at School scale for the TIMSS 2011 fourth grade assessment. Students were scored according to their responses to how often they experienced six bullying behaviors (detailed on the second page of the exhibit). Students bullied **Almost Never** reported “never” experiencing three of six bullying behaviors and each of the other three behaviors “a few times a year,” on average. Students bullied **About Weekly** experienced each of three of the six behaviors “once or twice a month” and each of the other three “a few times a year.” All other students were bullied **About Monthly**. On average across the fourth grade countries, 48 percent of the students **Almost Never** experienced these bullying behaviors; across countries the percentages ranged from 17 to 80 percent.

The majority of the fourth grade students reported being bullied either **About Monthly** or **About Weekly**. Internationally, on average across the fourth grade countries, 32 percent of the students were reportedly bullied **About Monthly** and 20 percent were bullied **About Weekly**.

The fourth grade students' reports about being bullied were related to their average science achievement on TIMSS 2011. Each successive category of increased bullying was related to a decrease in average science achievement; there was a 33-point difference in achievement between students who were **Almost Never** bullied and those who were bullied **About Weekly** (497 vs. 464).

Exhibit 6.12 provides the results for the TIMSS 2011 eighth grade assessment for the Students Bullied at School scale, which was based on the same six bullying behaviors as the fourth grade scale. In contrast to the

Exhibit 6.11: Students Bullied at School

Reported by Students

Students were scored according to their responses to how often they experienced six bullying behaviors on the *Students Bullied at School* scale. Students bullied **Almost Never** had a score on the scale of at least 10.1, which corresponds to “never” experiencing three of the six bullying behaviors and each of the other three behaviors “a few times a year,” on average. Students bullied **About Weekly** had a score no higher than 8.3, which corresponds to their experiencing each of three of the six behaviors “once or twice a month” and each of the other three “a few times a year,” on average. All other students were bullied **About Monthly**.

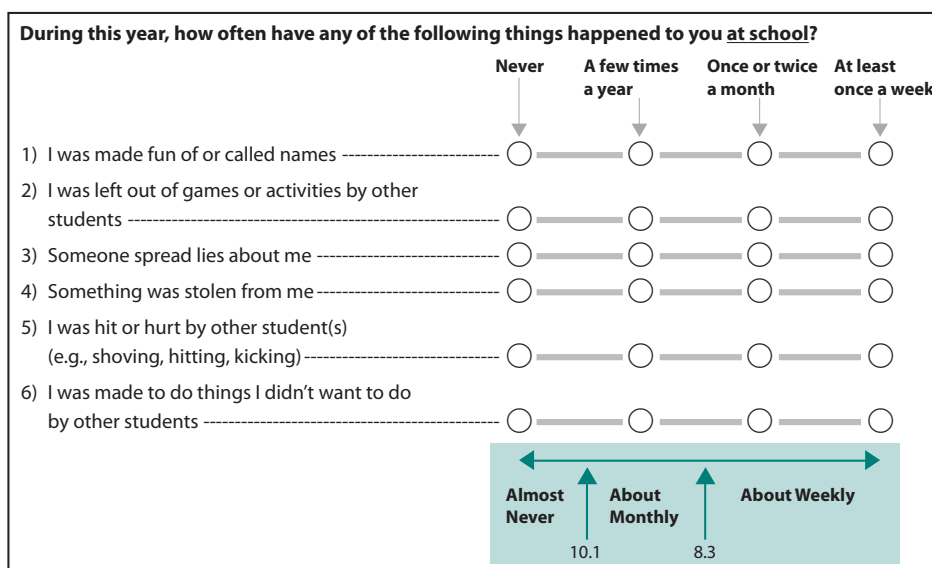

Exhibit 6.12: Students Bullied at School

Reported by Students

Students were scored according to their responses to how often they experienced six bullying behaviors on the *Students Bullied at School* scale. Students bullied **Almost Never** had a score on the scale of at least 9.6, which corresponds to “never” experiencing three of the six bullying behaviors and each of the other three behaviors “a few times a year,” on average. Students bullied **About Weekly** had a score no higher than 7.7, which corresponds to their experiencing each of three of the six behaviors “once or twice a month” and each of the other three “a few times a year,” on average. All other students were bullied **About Monthly**.

previous section, in which principals reported more school discipline and safety problems at the eighth grade than at the fourth grade, the eighth grade students reported experiencing somewhat less bullying behavior than did the fourth grade students. On average across countries, the majority of eighth grade students (59%) **Almost Never** experienced these bullying behaviors, compared to 48 percent at the fourth grade, whereas just 12 percent of the eighth grade students reported being bullied **About Weekly**, compared to 20 percent at the fourth grade. Similar to the fourth grade, there was a negative relationship between the eighth grade students' reports about being bullied and average science achievement, with students who were **Almost Never** bullied having achievement 31 points higher than those students who reported being bullied **About Weekly** (483 vs. 452).

Chapter 7

Teacher Preparation

Higher science achievement was related to teachers' having more teaching experience, being confident in their science teaching, and being satisfied with their careers.

The majority of fourth grade students had teachers with a bachelor's degree, and even more eighth grade students had teachers with bachelor's and postgraduate degrees. At both grades, most students had teachers that reported having at least ten years of teaching experience, being very well prepared to teach the TIMSS science topics, and feeling very confident in teaching science.

In view of the importance of a well prepared teaching force to an effective education system, TIMSS 2011 collected a range of information about teacher education. In the *TIMSS 2011 Encyclopedia*, each country chapter describes the educational route to teacher certification, including any additional requirements such as passing an examination or completing an induction year. Each encyclopedia chapter also addresses the requirements and practices for ongoing teacher professional development. Chapter 7 in this report provides information about teachers' education, experience, professional development, and satisfaction with their teaching careers.

Science Teachers' Formal Education

There is growing evidence that teacher preparation is a powerful predictor of students' achievement, perhaps even overcoming socioeconomic and language background factors (Darling-Hammond, 2000).

Exhibits 7.1 and 7.2 present teachers' reports about their highest level of formal education for the TIMSS 2011 fourth and eighth grade assessments, respectively. On average across the fourth grade countries, 23 percent of the students had science teachers with a postgraduate university degree, 57 percent had teachers with a bachelor's degree, 15 percent had teachers who had completed post-secondary education (usually a three-year teacher education program), and six percent had teachers with an upper secondary education. However, it is clear from examining the country-by-country results across the fourth grade, sixth grade, and benchmarking participants that different countries have different educational paths for becoming a primary level teacher. Similar results are shown in Exhibit 7.2 for the eighth grade students, although more students than at the fourth grade had teachers with bachelor's (63% vs. 57%) and postgraduate university degrees (27% vs. 23%).

Teachers Majoring in Education and Science

In addition to the importance of a college or university degree or advanced degree, the literature reports widespread agreement that teachers should have solid mastery of the content in the subject to be taught. For example, in a review of teacher quality research, Rice (2003) examined the relationship between teachers' advanced degrees and student achievement and found a positive relationship between subject-specific advanced degrees and student achievement in mathematics and in science.

Exhibit 7.3 shows the percentages of students in the TIMSS 2011 fourth grade assessment whose teachers had a major or specialization in primary

education and if they also had a major or specialization in science. Similar to the situation with formal education, there was a great deal of variation across countries in the degree of specialization by primary school teachers in science education. On average across the fourth grade countries, 25 percent of the students were taught science by a teacher with a major in both primary education and science, and almost half by a teacher with a major in primary education but not in science. Just 11 percent of the fourth grade students were taught science by a teacher with a major in science but not in primary education, and another 13 percent by a teacher with some other major. In several countries, one-third or more of the fourth grade and sixth grade students had science teachers without university degrees (Italy, Honduras, Morocco, Romania, Tunisia, and Yemen). However, as explained in the *TIMSS 2011 Encyclopedia*, countries have been implementing new policies that increase their teacher education requirements.

Science achievement was highest, on average, among students taught by teachers with a primary education major but not a science major (489), followed by students taught by a teacher with both majors (482), and then students taught by a teacher with some other major (479). Among the fourth grade students whose teachers had college degrees, average achievement was lowest among students taught by a teacher with a major in science but not in primary education (462).

As shown in Exhibit 7.4, the situation for science teachers of eighth grade students was somewhat different. The majority of eighth grade students were taught science by teachers who had a major in science but not in science education (51%), or who had a major in both (28%). There were only small differences in average science achievement associated with the majors of the students' teachers; students taught by teachers with a major in science and science education had somewhat higher achievement (480) than the 11 percent of students taught by teachers majoring in science education but not science (470). Almost all of the eighth grade students were taught science by teachers with college degrees (except in Morocco).

* Countries have been increasing their certification requirements and providing professional development to teachers certified under earlier guidelines.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (–) indicates comparable data not available. A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students.

Teachers' Years of Experience

It is difficult to examine the effects of teacher experience on student achievement, because sometimes more experienced teachers are assigned to students of higher ability and with fewer discipline problems, and other times the more experienced teachers are assigned to the lower-achieving students in need of more help. However, some research has addressed this selection bias problem; and experience can have a large positive impact primarily in the first few years of teaching, although the benefits can continue beyond the first five years of a teacher's career (Harris & Sass, 2011; Leigh, 2010).

Exhibit 7.5 presents teachers' reports about their years of experience for participants in the TIMSS fourth grade assessment. On average across the fourth grade countries, teachers of science had been teaching for an average of 17 years. Forty percent of the students, on average, had teachers with 20 years or more of experience, and another 30 percent had teachers with at least 10 (but less than 20) years of experience. On average across countries, science achievement was highest for students whose teachers had 20 or more years of experience (494), compared to those whose teachers had between 10 and 20 years of experience (485), between 5 and 10 years of experience (483), or less than five years of experience (482).

Exhibit 7.6 shows science teachers' reports from the eighth grade assessment about their years of experience. On average, the eighth grade teachers were somewhat less experienced than their fourth grade counterparts (15 years vs. 17 years), leading to lesser percentages of students taught by experienced teachers—62 percent were taught by teachers with at least ten years of experience, compared to 70 percent of fourth grade students. Also, the relationship between teacher experience and average student achievement was less pronounced among the eighth grade students. On average across countries, achievement was highest for students whose teachers had 20 or more years of experience or between 10 and 20 years of experience (480 in each case), compared to students whose teachers had between 5 and 10 years of experience (475), or less than five years of experience (471).

Teachers' Professional Development

Evidence from recent meta-analyses of research conducted in the United States shows that teacher professional development focused on science content has a significant positive effect on student achievement (Blank & de las Alas, 2009) and that the amount of professional development (more than 14 hours) was an important factor (Yoon, Duncan, Lee, Scarloss, & Shapley, 2007).

Exhibit 7.7 presents, for the fourth grade TIMSS assessment, teachers' reports about areas of professional development in science in which they had participated in the past two years. Although there was considerable variation across countries, the most common areas of science professional development for teachers of fourth grade students were science content (35%), science pedagogy and instruction (34%), and science curriculum (34%). On average, about one-third of students had teachers who had professional development in each of these three areas. Integrating information technology into science and science assessment were somewhat less common areas of professional development, with 28 percent and 27 percent of students, respectively, taught by teachers who had professional development in these areas in the past two years.

As shown in Exhibit 7.8, science teachers of students in the TIMSS eighth grade assessment reported somewhat higher levels of participation in science professional development than teachers of the fourth grade students. On average across the eighth grade countries, the majority of students were taught by science teachers who had participated in professional development in science pedagogy and instruction (58%), science content (55%), or science curriculum (53%) in the past two years. Slightly less than half of the students had teachers with professional development in integrating information technology into science, science assessment, and improving students' critical thinking or inquiry skills.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for less than 50% of students.

Teachers' Preparation to Teach the TIMSS Science Topics

Although a sound knowledge of science would seem to be a prerequisite for effective science teaching, evidence directly linking teacher preparation in science to the achievement of their students is scarce. A meta-analysis of the effects of teachers' subject matter preparation on their students' achievement in mathematics and science found some studies showing a positive effect, but in general results were mixed (Wilson, Floden, & Ferrini-Mundi, 2002).

TIMSS 2011 gathered information from the teachers of students taking the assessment about whether they felt very well prepared, somewhat prepared, or not well prepared to teach the science content topics assessed by TIMSS. Exhibit 7.9 presents reports of teachers about their level of preparation to teach the science topics in the fourth grade assessment. The 20 science topics are shown on the second page of the exhibit, grouped by content domain (life science, physical science, and earth science). The exhibit presents for each participant the percentage of students taught by teachers who felt "very well" prepared to teach the TIMSS topics. The results are averaged across all 20 topics for a perspective on science overall, as well as separately by content domain: six topics in life science, eight topics in physical science, and six topics in earth science. On average across the fourth grade countries, 62 percent of students were taught by teachers who felt very well prepared to teach the TIMSS science topics. Across the content domains, a larger percentage of students had teachers who felt very well prepared to teach the life science topics (70%) than the physical science topics (62%) and the earth science topics (53%). However, these results varied considerably across countries; for example, in several countries larger percentages of students were taught by teachers who felt very well prepared to teach the physical science topics than the topics in the other two domains.

Exhibit 7.10 presents reports of teachers about their level of preparation to teach the science topics in the four content domains covered by the eighth grade assessment. The 20 topics are shown on the second page of the exhibit, grouped by content domain (biology, chemistry, physics, and earth science). Compared to the fourth grade, a larger percentage of eighth grade students (72%) were taught by teachers who felt very well prepared to teach the TIMSS science topics. Across the content domains, most students had teachers who felt very well prepared to teach biology topics (77%), chemistry topics (82%), and physics topics (78%); however, fewer than half of the students (47%) had teachers who felt well prepared to teach the earth science topics. While the results varied across countries, this general pattern was observed in many of the eighth grade countries, ninth grade countries, and benchmarking participants.

Teachers' Confidence in Teaching Science

Teachers with a strong sense of personal ability to organize and execute their teaching are more open to new ideas and less likely to experience emotional burnout. Research has shown that teachers' self-confidence in their teaching skills is not only associated with their professional behavior, but also with students' performance and motivation (Bandura, 1997; Henson, 2002).

To investigate teachers' confidence in teaching science, teachers of students taking the fourth and eighth grade TIMSS assessments were asked to indicate how confident they feel about doing each of the following:

- ◆ Answer students' questions about science;
- ◆ Explain science principles or concepts by doing science experiments;
- ◆ Provide challenging tasks for capable students;
- ◆ Adapt their teaching to engage students' interest; and
- ◆ Help students appreciate the value of learning science.

TIMSS 2011 Science Topics

A. Life Science

- 1) Major body structures and their functions in humans and other organisms (plants and animals)
- 2) Life cycles and reproduction in plants and animals
- 3) Physical features, behavior, and survival of organisms living in different environments
- 4) Relationships in a given community (e.g., simple food chains, predator-prey relationships)
- 5) Changes in environments (effects of human activity, pollution and its prevention)
- 6) Human health (e.g., transmission/prevention of communicable diseases, signs of health/illness, diet, exercise)

B. Physical Science

- 1) States of matter (solids, liquids, gases) and differences in their physical properties (shape, volume), including changes in state of matter by heating and cooling
- 2) Classification of objects/materials based on physical properties (e.g., weight/mass, volume, magnetic attraction)
- 3) Forming and separating mixtures
- 4) Familiar changes in materials (e.g., decaying, burning, rusting, cooking)
- 5) Common energy sources/forms and their practical uses (e.g., the Sun, electricity, water, wind)
- 6) Light (e.g., sources, behavior)
- 7) Electrical circuits and properties of magnets
- 8) Forces that cause objects to move (e.g., gravity, push/pull forces)

C. Earth Science

- 1) Water on Earth (location, types, and movement) and air (composition, proof of its existence, uses)
- 2) Common features of Earth's landscape (e.g., mountains, plains, rivers, deserts) and relationship to human use (e.g., farming, irrigation, land development)
- 3) Weather conditions from day to day or over the seasons
- 4) Fossils of animals and plants (age, location, formation)
- 5) Earth's solar system (planets, Sun, moon)
- 6) Day, night, and shadows due to Earth's rotation and its relationship to the Sun

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

TIMSS 2011 Science Topics

A. Biology

- 1) Major organs and organ systems in humans and other organisms (structure/function, life processes that maintain stable bodily conditions)
- 2) Cells and their functions, including respiration and photosynthesis as cellular processes
- 3) Reproduction (sexual and asexual) and heredity (passing on of traits, inherited versus acquired/learned characteristics)
- 4) Role of variation and adaptation in survival/extinction of species in a changing environment
- 5) Interdependence of populations of organisms in an ecosystem (e.g., energy flow, food webs, competition, predation) and the impact of changes in the physical environment on populations (e.g., climate, water supply)
- 6) Reasons for increase in world's human population (e.g., advances in medicine, sanitation), and the effects of population growth on the environment
- 7) Human health (causes of infectious diseases, methods of infection, prevention, immunity) and the importance of diet and exercise in maintaining health

B. Chemistry

- 1) Classification, composition, and particulate structure of matter (elements, compounds, mixtures, molecules, atoms, protons, neutrons, electrons)
- 2) Solutions (solvent, solute, concentration/dilution, effect of temperature on solubility)
- 3) Properties and uses of common acids and bases
- 4) Chemical change (transformation of reactants, evidence of chemical change, conservation of matter, common oxidation reactions - combustion, rusting, tarnishing)

C. Physics

- 1) Physical states and changes in matter (explanations of properties in terms of movement and distance between particles; phase change, thermal expansion, and changes in volume and/or pressure)
- 2) Energy forms, transformations, heat, and temperature
- 3) Basic properties/behaviors of light (reflection, refraction, light and color, simple ray diagrams) and sound (transmission through media, loudness, pitch, amplitude, frequency, relative speed of light and sound)
- 4) Electric circuits (flow of current; types of circuits - parallel/series; current/voltage relationship) and properties and uses of permanent magnets and electromagnets
- 5) Forces and motion (types of forces, basic description of motion, effects of density and pressure)

D. Earth Science

- 1) Earth's structure and physical features (Earth's crust, mantle and core; composition and relative distribution of water, and composition of air)
- 2) Earth's processes, cycles, and history (rock cycle; water cycle; weather patterns; major geological events; formation of fossils and fossil fuels)
- 3) Earth's resources, their use, and conservation (e.g., renewable/nonrenewable resources, human use of land/soil, water resources)
- 4) Earth in the solar system and the universe (phenomena on Earth - day/night, tides, phases of moon, eclipses, seasons; physical features of Earth compared to other bodies; the Sun as a star)

Exhibit 7.11 shows the fourth grade TIMSS assessment results for the Confidence in Teaching Science scale. Students were scored according to their teachers' responses, with **Very Confident** teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other teachers were considered to be **Somewhat Confident**. On average across countries, the majority of fourth grade students (59%) had teachers who were **Very Confident** in teaching science to the class; however, there was no significant difference between the average science achievement of these students (487) and that of the 41 percent of students whose teachers were only **Somewhat Confident** (485). There was considerable variation across countries, with the percentage of students having teachers who were **Very Confident** ranging from 14 to 95 percent.

Exhibit 7.12 provides further information about the components of the Confidence in Teaching Science scale by showing the percentage of students whose teachers reported feeling "very confident" in using each of the five instructional strategies. On average across the fourth grade countries, teachers were most often very confident about helping students appreciate the value of learning science (68% of students taught by such teachers), adapting their teaching to engage student interests (63%), and answering student questions about science (62%). Teachers were less often very confident about explaining science concepts or principles by doing science experiments (51% of students) and providing challenging tasks for capable students (43%).

Exhibit 7.13 shows results for the Confidence in Teaching Science scale for the eighth grade TIMSS assessment. On average across countries, a larger percentage of students had teachers who were **Very Confident** (73%) than at fourth grade, and unlike fourth grade, students who had teachers who were **Very Confident** had higher achievement (479) than did students who had teachers who were **Somewhat Confident** (467). Again, there was considerable variation among countries, with the percentage of students with **Very Confident** teachers ranging from 33 to 99 percent.

Exhibit 7.14 provides information about the components of the Confidence in Teaching Science scale for the eighth grade assessment. Patterns of teacher confidence differed from those at fourth grade—on average across countries, teachers were most often very confident about answering student questions about science (81% of students taught by such teachers), explaining science concepts or principles by doing science experiments (72%), and helping students appreciate the value of science (70%). Teachers were less often very confident about adapting their teaching to engage student interests (65% of students) and providing challenging tasks for capable students (57%).

Exhibit 7.11: Confidence in Teaching Science

Reported by Teachers

Students were scored according to their teachers' responses to how confident they felt in using five instructional strategies on the *Confidence in Teaching Science* scale. Students with **Very Confident** teachers had a score on the scale of at least 9.9, which corresponds to their teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other students had **Somewhat Confident** teachers.

Country	Very Confident		Somewhat Confident		Average Scale Score
	Percent of Students	Average Achievement	Percent of Students	Average Achievement

Exhibit 7.13: Confidence in Teaching Science

Reported by Teachers

Students were scored according to their teachers' responses to how confident they felt in using five instructional strategies on the *Confidence in Teaching Science* scale. Students with **Very Confident** teachers had a score on the scale of at least 9.3, which corresponds to their teachers being "very confident" in using three of the five instructional strategies and "somewhat confident" in using the other two, on average. All other students had **Somewhat Confident** teachers.

Country	Very Confident		Somewhat Confident		Average Scale Score

Teachers' Career Satisfaction

Teachers who are satisfied with their profession and the working conditions at their school are more motivated to teach and prepare their instruction. Further, having teachers that can provide leadership is a dimension of teacher quality. However, developing master teachers requires retention in the profession. Teachers need to be committed to the profession and like it enough to continue teaching. It may be that some subject areas and locales would benefit from policies to reduce teacher attrition in order to improve student achievement (Boyd, Grossman, Lankford, Loeb, & Wyckoff, 2009).

Exhibit 7.15 shows the fourth grade TIMSS assessment results for the TIMSS 2011 Teacher Career Satisfaction scale, based on how much teachers agreed with each of the following six statements:

- ◆ I am content with my profession as a teacher;
- ◆ I am satisfied with being a teacher at this school;
- ◆ I had more enthusiasm when I began teaching than I have now (reverse coded);
- ◆ I do important work as a teacher;
- ◆ I plan to continue as a teacher for as long as I can; and,
- ◆ I am frustrated as a teacher (reverse coded).

Students were scored according to their teachers responses, with **Satisfied** teachers “agreeing a lot” with three of the six statements and “agreeing a little” with the other three, on average. Internationally, on average, the majority of fourth grade students (54%) had teachers **Satisfied** with their careers. Another 41 percent of the students, on average, had teachers that reported being **Somewhat Satisfied** (mostly agreed “a little” instead of “a lot”). Despite the fact that satisfaction could be relative, and dependent on the teaching situation, very few fourth grade students had science teachers that expressed any dissatisfaction except in a small number of countries.

On average across countries, at the fourth grade, science achievement was higher for students of **Satisfied** teachers (490) than for students of **Somewhat Satisfied** (483) or **Less Than Satisfied Teachers** (483), though this varied considerably from country to country. In particular, it is noteworthy that several of the highest-performing countries in science at the fourth grade—Singapore, Japan, and Korea—had among the lowest percentages of students taught by **Satisfied** teachers.

As shown in Exhibit 7.16, on average across countries, the eighth grade science teachers reported somewhat lower levels of career satisfaction than the fourth grade teachers, with 47 percent of students taught by **Satisfied** teachers (compared to 54% at the fourth grade). However, taken together, almost all of the eighth grade students (92%) were taught science by teachers who were **Satisfied** or **Somewhat Satisfied** with their careers. Similar to the fourth grade results, on average across countries, the eighth grade students taught by **Satisfied** teachers had higher science achievement (481) than those taught by **Somewhat Satisfied** (474) or **Less Than Satisfied** teachers (473).

Exhibit 7.15: Teacher Career Satisfaction

Reported by Teachers

Students were scored according to their teachers' degree of agreement with six statements on the *Teacher Career Satisfaction* scale. Students with **Satisfied** teachers had a score on the scale of at least 10.1, which corresponds to their teachers "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Students with **Less Than Satisfied** teachers had a score no higher than 6.6, which corresponds to their teachers "disagreeing a little" with three of the six statements and "agreeing a little" with the other three, on average. All other students had **Somewhat Satisfied** teachers.

Exhibit 7.16: Teacher Career Satisfaction

Reported by Teachers

Students were scored according to their teachers' degree of agreement with six statements on the *Teacher Career Satisfaction* scale. Students with **Satisfied** teachers had a score on the scale of at least 10.4, which corresponds to their teachers "agreeing a lot" with three of the six statements and "agreeing a little" with the other three, on average. Students with **Less Than Satisfied** teachers had a score no higher than 7.0, which corresponds to their teachers "disagreeing a little" with three of the six statements and "agreeing a little" with the other three, on average. All other students had **Somewhat Satisfied** teachers.

Chapter 8

Classroom Instruction

Overall, students with positive attitudes toward science have higher achievement, but these attitudes deteriorate over time. Internationally, by the eighth grade, fewer students like learning science and feel confident in their abilities (compared to the fourth grade). In countries teaching science as separate subjects, students like learning chemistry and physics less than biology and earth science, and are less confident in their abilities in them.

Engaging instruction, good nutrition, and enough sleep were related to higher achievement. However, by the eighth grade, only one-quarter of the students reported being engaged in their science lessons, and nearly as many reported being not engaged. Also, in the majority of eighth grade classrooms, instruction was limited because students were suffering from lack of sleep.

This chapter considers the learning environment of the classroom itself, because classroom instruction is at the core of student learning. Previous chapters of this report have described how teaching effectiveness can be greatly influenced by students' home and school environments as well as by teachers' preparation. However, even though the curricular policies and school resources often set the tone for accomplishment, students' day-to-day classroom activities are likely to have a considerable direct impact on their science learning.

TIMSS routinely presents very powerful evidence showing that within countries students with more positive attitudes toward science have substantially higher achievement, and the results from TIMSS 2011 are consistent with previous assessments. In addition to being motivated to learn, students need the opportunity to learn. Thus, this chapter also provides information about the instructional time devoted to science and the approaches teachers use to engage students in learning. It is difficult, however, for teachers to engage students in learning if students do not have the prerequisite skills or are too sleep deprived or disruptive to pay attention. Finally, an effective classroom environment for science learning involves using a variety of instructional approaches, capitalizing on technology, and at the eighth grade, extending instruction with homework and regularly assessing student progress.

Students' Attitudes Toward Science

Each successive TIMSS assessment has shown a strong positive relationship within countries between student attitudes toward science and their science achievement. Additionally, there is extensive research showing that students with more positive attitudes toward mathematics and science have higher average achievement in mathematics and science. For example, a recent meta-analysis of student attitudes toward school found that attitudes toward mathematics or science were related to mathematics and science achievement across 288 studies (Hattie, 2009). While positive attitudes and high achievement in science go hand in hand, it should be understood that the relationship is bidirectional, with attitudes and achievement mutually influencing each other. Students who are good at science also are more likely to enjoy learning science.

Much research about students' attitudes toward learning has studied the complex phenomenon of motivation. For example, students' motivation to learn can be affected by whether they find the subject enjoyable and place value on the subject. In addition, students' motivation can be affected by their self-confidence in learning the subject. TIMSS 2011 included scales about three

motivational constructs: intrinsic value (interest), utility value, and ability beliefs. Essentially, intrinsic motivation refers to doing an activity because it is interesting or enjoyable, and the Students Like Learning Science scale was developed to measure students' interest in and liking of learning science. In contrast, extrinsic motivation refers to doing something because it leads to a desirable outcome. There are many types of external motivation from teacher praise, to good grades, to being accepted to a good university, to having a successful career and daily life. In particular, the TIMSS 2011 Students Value Science scale addresses students' attitudes about the importance of the subject and usefulness of the subject, sometimes called attainment value and utility value (Wigfield & Eccles, 2000). Finally, motivation to learn includes having the feeling that you can succeed. The Student Confidence with Science scale assesses students' self-confidence or self-concept in their ability to learn science. A strong self-concept encourages students to engage with the instruction and show persistence, effort, and attentiveness.

Students Like Learning Science

Exhibit 8.1 presents the fourth grade results for the TIMSS 2011 Students Like Learning Science scale. Students were scored according to the degree of their agreement with five statements such as “I enjoy learning science,” “Science is boring” (reverse coded), and “I learn many interesting things in science” (see second page of the exhibit for details). Students in the **Like Learning Science** category “agreed a lot” with three of the five statements and “agreed a little” with the other two, on average. In contrast, students who **Do Not Like Learning Science** “disagreed a little” with three of the statements and “agreed a little” with the other two, on average.

For each TIMSS 2011 participant, the percentage of students in each category is shown together with the students' average science achievement. The first page of the exhibit presents the results for countries participating at the fourth grade, and the average results across those countries. The second page of the exhibit presents the results for the sixth grade and benchmarking participants.

On average, more than half of the fourth grade students internationally **Like Learning Science**, substantially more than **Do Not Like Learning Science** (53% vs. 12%). The remaining fourth grade students (35%, on average) **Somewhat Like Learning Science**. Most important, however, on average, internationally, and in almost all TIMSS 2011 countries, including the sixth

Exhibit 8.1: Students Like Learning Science

Reported by Students

Students were scored according to their degree of agreement with five statements on the *Students Like Learning Science* scale. Students who **Like Learning Science** had a score on the scale of at least 9.7, which corresponds to their “agreeing a lot” with three of the five statements and “agreeing a little” with the other two, on average. Students who **Do Not Like Learning Science** had a score no higher than 7.6, which corresponds to their “disagreeing a little” with three of the five statements and “agreeing a little” with the other two, on average. All other students **Somewhat Like Learning Science**.

grade and benchmarking participants, students who liked learning science had higher average science achievement than those who only somewhat or did not like learning science.

Exhibit 8.2 presents the corresponding results for the eighth grade on the Students Like Learning Science scale. Because 16 of the TIMSS countries teach science subjects separately (i.e., biology, chemistry, physics, and earth science) at the eighth grade rather than as a general or integrated subject, TIMSS asked students in these countries about their liking for the individual science subjects and the results were scaled separately for each subject. The first page of Exhibit 8.2 presents the results for general or integrated science for the eighth grade countries, and also for the ninth grade and benchmarking participants, as all of these teach science as a general or integrated subject. The second and third pages of the exhibit present the results for biology (second page) and chemistry, physics, and earth science (third page) in separate panels.

Looking first at general or integrated science and comparing to the fourth grade, substantially fewer eighth grade students reported positive attitudes toward learning science. At the eighth grade, about one-third (35%) of the students, internationally, on average, **Like Learning Science** (compared to 53% at the fourth grade), and about one-fifth (21%) **Do Not Like Learning Science**. Accompanying the decrease from the fourth to eighth grades in liking learning science is a widening achievement gap between students who like learning science (515, on average) and those who do not (450).

It is noticeable that some of the highest performing countries have the smallest percentages of students reporting positive attitudes toward learning science, such as Chinese Taipei, Japan, and Korea. The tendency of smaller percentages of students in some East Asian countries to report positive attitudes is consistent with previous TIMSS assessments. The relatively low percentages of students liking learning science may partially result from the high level of difficulty of the science being studied, and also these countries have a cultural tradition of serious attitudes toward learning.

Across countries teaching the sciences as separate subjects, the average percentages of students liking learning biology and earth science (36% and 33%, respectively) were similar to the percentage liking general or integrated science, but fewer students reported liking learning chemistry (25%) and physics (26%). In all four science subjects, the students who liked learning the subject had higher average achievement than those who only somewhat liked or did not like learning it.

Exhibit 8.2: Students Like Learning Science

Reported by Students

The general/integrated science panel summarizes responses for countries where students are enrolled in science as a single subject. The remaining panels for biology, chemistry, physics, and earth science summarize responses for countries where students are taught science as separate subjects.

For general/integrated science, students were scored according to their degree of agreement with five statements on the *Students Like Learning Science* scale. Students who **Like Learning Science** had a score on the scale of at least 10.8, which corresponds to their "agreeing a lot" with three of the five statements and "agreeing a little" with the other two, on average. Students who **Do Not Like Learning Science** had a score on the scale no higher than 8.4, which corresponds to their "disagreeing a little" with three of the five statements and "agreeing a little" with the other two, on average. All other students **Somewhat Like Learning Science**. For biology, chemistry, physics, and earth science, a comparable procedure was used.

Centerpoint of scale set at 10.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (–) indicates comparable data are not available.

An "r" indicates data are available for at least 70% but less than 85% of the students.

Students Value Science

Exhibit 8.3 presents the results for the TIMSS 2011 Students Value Science scale, which only was given at the eighth grade. The scale itself addresses six different aspects of valuing science:

- ◆ I think learning science will help me in my daily life;
- ◆ I need science to learn other school subjects;
- ◆ I need to do well in science to get into the university of my choice;
- ◆ I need to do well in science to get the job I want;
- ◆ I would like a job that involves using science; and
- ◆ It is important to do well in science.

Students in countries teaching the sciences as separate subjects were asked about each of the four science subjects and the results were scaled separately. On each scale, students with a score corresponding to “agreeing a lot” with three of the statements and “agreeing a little” with the other three, on average, were considered to **Value** science. In comparison, students in the **Do Not Value** science category “disagreed a little” with three of the statements and “agreed a little” with the other three, on average. The first page of Exhibit 8.3 presents the results for general or integrated science for the eighth grade countries, and also for the ninth grade and benchmarking participants. The second and third pages of the exhibit present the results for biology (second page) and chemistry, physics, and earth science (third page) in separate panels.

Internationally, on average, eighth grade students in general or integrated science countries placed a high value on science. Forty-one percent were in the **Value** category and another 33 percent were in the **Somewhat Value** category, on average. However, about one-fourth (26%) were in the **Do Not Value** category. Across the eighth grade, ninth grade, and benchmarking participants, students who said they valued science typically had higher achievement than students who only valued it somewhat, and those students, in turn, had higher achievement than students who did not value science.

Students in countries teaching the sciences as separate subjects do not seem to value the individual science subjects in the same way as students in general science countries value science. Across the four subjects, only about one-fourth (25–29%) of the students reported that they value the science subjects, about one-third (33–36%) reported that they somewhat value the subjects, and about two-fifths (36–42%) reported that they did not value them. This

Exhibit 8.3: Students Value Science

Reported by Students

The general/integrated science panel summarizes responses for countries where students are enrolled in science as a single subject. The remaining panels for biology, chemistry, physics, and earth science summarize responses for countries where students are taught science as separate subjects.

For general/integrated science, students were scored according to their degree of agreement with six statements on the *Students Value Science* scale. Students who **Value** science had a score on the scale of at least 10.5, which corresponds to their “agreeing a lot” with three of the six statements and “agreeing a little” with the other three, on average. Students who **Do Not Value** science had a score no higher than 8.6, which corresponds to their “disagreeing a little” with three of the six statements and “agreeing a little” with the other three, on average. All other students **Somewhat Value** science. For biology, chemistry, physics, and earth science, a comparable procedure was used.

Centerpoint of scale set at 10.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (–) indicates comparable data are not available.

An “r” indicates data are available for at least 70% but less than 85% of the students.

may be partly due to the nature of the questions making up the Students Value Science scale, several of which may be more suited to a general subject such as reading, mathematics, or science than to the more specific biology, chemistry, physics, and earth science. For example, students may indeed value science very highly and yet not agree that they “need biology to learn other school subjects” (question 2 on the scale), or that they “need to do well in earth science to get the job I want” (question 4 on the scale). As a result, the Students Value Science scale may underestimate the extent to which students in separate science countries actually value science, and inflate the percentage of students in the **Do Not Value** category. This may somewhat explain the absence of relationship with science achievement in chemistry and physics and the anomalous finding of higher average science achievement among students who **Do Not Value** biology and earth science compared to those who do value these subjects.

Students Confident in Science

Exhibit 8.4 presents the fourth grade results for the TIMSS 2011 Students Confident in Science scale, which includes six statements such as “Science is harder for me than for many of my classmates” (reverse coded) and “My teacher tells me I am good at science” (see second page of exhibit for all six statements). **Confident** students “agreed a lot” with three of the six statements and “agreed a little” to the other three, on average. Students **Not Confident** in science “disagreed a little” with three of the statements and “agreed a little” with the other three, on average.

Internationally, on average, 43 percent of the fourth grade students expressed confidence in their science ability. Average science achievement was highest for the **Confident** fourth grade students and lowest (by 68 points) for the students lacking confidence (21% across countries). Similar to the results for “liking” to learn science at the eighth grade, students in some of the highest performing countries expressed the least confidence. For the sixth grade participants, somewhat fewer students expressed confidence (28–39%) and somewhat more expressed a lack of confidence (23–30%).

As shown in Exhibit 8.5 (second page), the TIMSS 2011 Student Confidence with Science scale for the eighth grade included nine statements, five of which also were included in the fourth grade scale. As with the other attitudinal scales, students in countries teaching the sciences as separate subjects were asked about each of the four science subjects and the results were scaled separately. On average internationally, only 20 percent of the eighth grade

students in general or integrated science countries expressed confidence in their science ability, with 49 percent **Somewhat Confident** and 31 percent **Not Confident**. The average achievement gap was large—86 points—between the **Confident** students and those **Not Confident**. To at least some extent, the eighth grade results for general or integrated science held constant across the ninth grade and benchmarking participants.

The eighth grade students in separate science countries were similar to students in general or integrated countries in their confidence with biology and earth science (21–19% confident, respectively), but less confident with chemistry and physics (14% confident for each). In all four science subjects there was a strong positive relationship between student confidence and average science achievement.

Exhibit 8.4: Students Confident in Science

Reported by Students

Students were scored according to their degree of agreement with six statements on the *Students Confident in Science* scale. Students **Confident** in science had a score on the scale of at least 10.1, which corresponds to their “agreeing a lot” with three of the six statements and “agreeing a little” with the other three, on average. Students who were **Not Confident** had a score no higher than 8.3, which corresponds to their “disagreeing a little” with three of the six statements and “agreeing a little” with the other three, on average. All other students were **Somewhat Confident** in science.

Country	Confident		Somewhat Confident		Not Confident		Average Scale Score

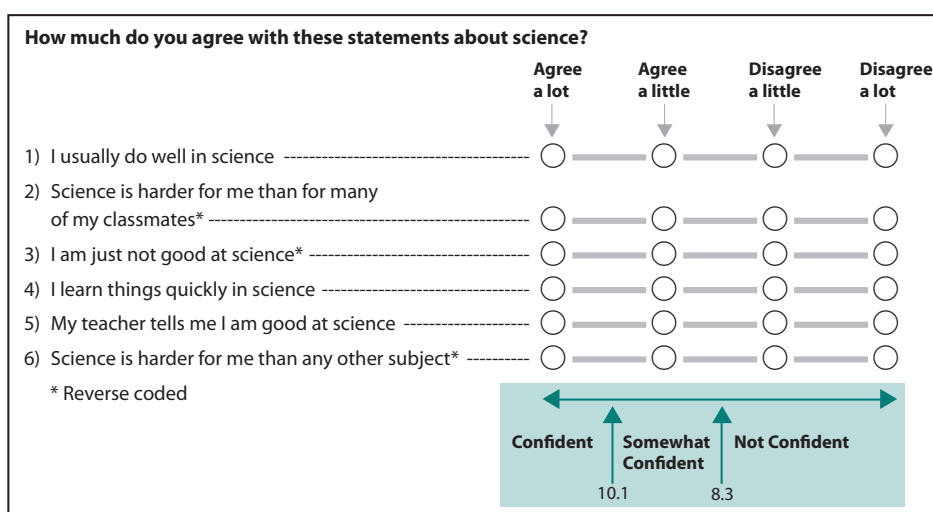

Exhibit 8.5: Students Confident in Science

Reported by Students

The general/integrated science panel summarizes responses for countries where students are enrolled in science as a single subject. The remaining panels for biology, chemistry, physics, and earth science summarize responses for countries where students are taught science as separate subjects.

For general/integrated science, students were scored according to their degree of agreement with nine statements on the *Students Confident in Science* scale. Students **Confident** in science had a score on the scale of at least 11.5, which corresponds to their "agreeing a lot" with five of the nine statements and "agreeing a little" with the other four, on average. Students who were **Not Confident** had a score no higher than 9.0, which corresponds to their "disagreeing a little" with five of the nine statements and "agreeing a little" with the other four, on average. All other students were **Somewhat Confident** in science. For biology, chemistry, physics, and earth science, a comparable procedure was used.

Instructional Time

Instructional Time Spent on Science

It is difficult to examine the effect of instructional time on student achievement, because a wide variety of factors influence the productivity of instruction hours—most importantly, the quality of the curriculum and instructional approaches (and all of the variables influencing them). In addition, the relationship between instructional time and student achievement is highly dependent on the effectiveness of the educational system. If an education system essentially is ineffective, increasing the amount of instruction time will have diminishing returns. Also, most countries implement levels of instructional time across their systems so that any variation is unintended and rarely related to achievement.

Despite the difficulties in studying its effects, instructional time remains a crucial resource in considering students' opportunity to learn. If everything else about schooling was equal and of high quality, more instructional time should result in increased student learning. For example, a recent study published by the London School of Economics used data from PISA 2006 and from 10- and 13-year-olds in Israel to compare achievement estimates for the same students across curriculum subjects, and found that instructional time has a positive and significant effect on achievement (Lavy, 2010).

Exhibits 8.6 and 8.7 present principals' and teachers' reports about the instructional hours per year spent on science instruction, respectively, at the fourth and eighth grades. The results for the time spent on science instruction were based on a series of calculations. As explained on the second page of the exhibits, principals provided the number of school days per year and the number of instructional hours per day. This information was combined to provide the yearly total number of instructional hours in each country shown in the first column of the exhibit. There was substantial variation across countries, but the fourth grade students in the TIMSS 2011 countries averaged about 900 hours per year of instruction, while those in the eighth grade averaged about 1,000 hours.

Teachers reported the weekly amount of instruction in science. This information was combined with the data provided by principals to estimate yearly amounts of instructional time in science for each TIMSS 2011 participant (second column in the exhibits). On average, the fourth grade countries reported devoting 85 hours per year to science instruction, although the amount of instructional time varied widely across the fourth grade, sixth grade, and benchmarking participants, from a low of 39 to a high of 162 hours.

Exhibit 8.6: Instructional Time Spent on Science

Reported by Principals and Teachers

 \end{aligned}$$

Instructional time for science was much greater at the eighth grade, with the eighth grade countries devoting an average of 158 hours to science instruction, and there was greater variability across countries, from 64 to 334 hours. The large increase in science instructional time compared to the fourth grade was mainly the result of the greater attention given to science instruction in the separate science countries. For these countries, the number of hours reported for each of biology, chemistry, physics, and earth science is shown on the second page of Exhibit 8.7. The separate science countries devote 54 to 59 hours per year, on average, to each science subject, for an overall average of 225 hours of science instruction per year.

It should be noted that the variation across countries in science instructional time at both the fourth and eighth grades (including the sixth and ninth grades, respectively, and the benchmarking participants) is due to countries spending different amounts of time on total schooling, and allocating different amounts of the total time to science instruction, and in different ways. Finally, it should be understood that providing time for instruction is a necessary but not sufficient condition for student learning; the time allocated for instruction is a resource that needs to be used effectively, and efficiently.

Students Taught the TIMSS Science Topics

The science content and topic areas assessed in TIMSS 2011 are elaborated in the Science Framework, with each topic area for the fourth and eighth grades presented as comprehensive lists of objectives. Developed collaboratively by the participating countries, the TIMSS topics do not represent the “least common denominator” but rather a forward-looking conception of science teaching and learning.

Exhibit 8.8 presents teachers’ reports about the TIMSS science topics that actually had been taught to students in fourth grade classrooms either prior to or during the year of the assessment. The exhibit shows, for each TIMSS participant, the percentage of students whose teachers reported that the students had been taught each of the topics, averaged across all science topics and across all topics within each science content domain. The topics are shown on the second page of the exhibit. At the fourth grade, teachers were asked about a total of 20 topics: six in life science, eight in physical science, and six in earth science.

At the fourth grade, according to their teachers, 64 percent of students, on average, had been taught the TIMSS science topics overall. There was considerable variation across countries, from 93 percent in Kuwait to 38 percent in Japan. On average, the percentage of students taught various topics was

highest for life science (75%), next highest for earth science (63%), and lowest for physical science (57%). However, including the fourth grade, sixth grade, and the benchmarking participants, there was considerable variation from topic to topic and from participant to participant.

Exhibit 8.9 presents teachers' reports about the TIMSS science topics that actually had been taught to students in eighth grade science classrooms either prior to or during the year of the assessment. The exhibit shows, for each participant, the percentage of students whose teachers reported that the students had been taught each of the topics, averaged across all science topics and across all topics within each science content domain. The topics are shown on the second page of the exhibit. At the eighth grade, teachers were asked about a total of 20 topics: seven in biology, four in chemistry, five in physics, and four in earth science.

At the eighth grade, on average, 72 percent of students had been taught the science topics overall. Teachers' reports about the degree of implementation ranged from 98 percent in Macedonia to 39 percent in Norway. Chemistry had the greatest degree of coverage, with 81 percent of students having been taught the chemistry topics at the eighth grade, followed by physics, with 75 percent of students taught the topics. The coverage for biology and earth science was similar, with 68 percent of the students being taught the topics in each of those two content areas. It should be emphasized that there was considerable variation across participants in relative coverage of the topics in the content domains.

National Research Coordinators were asked to indicate whether each of the TIMSS 2011 science topics was included in their countries' intended curriculum through the fourth or eighth grade, and if so, whether the topics were intended to be taught to "all or almost all students" or "only the more able students." The results for the fourth and eighth grades are summarized in Exhibits 8.10 and 8.11. On average, across countries, the majority of the assessment topics were intended for all students—14 out of 20 at the fourth grade, and 17 out of 20 at the eighth grade.

At the fourth grade, the results varied topic by topic and country by country. However, of the six life science topics, on average, five were included in the curriculum for all students and one was not included; of the eight physical science topics, five were included and two were not; and of the six earth science topics, four were included and two were not. At the eighth grade, there was also considerable variation across countries, but with most of the topics in each content domain included in the curriculum for all students. On average across the eighth grade students, six of the seven biology topics, three of the four

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

TIMSS 2011 Science Topics
A. Life Science

- 1) Major body structures and their functions in humans and other organisms (plants and animals)
- 2) Life cycles and reproduction in plants and animals
- 3) Physical features, behavior, and survival of organisms living in different environments
- 4) Relationships in a given community (e.g., simple food chains, predator-prey relationships)
- 5) Changes in environments (effects of human activity, pollution and its prevention)
- 6) Human health (e.g., transmission/prevention of communicable diseases, signs of health/illness, diet, exercise)

B. Physical Science

- 1) States of matter (solids, liquids, gases) and differences in their physical properties (shape, volume), including changes in state of matter by heating and cooling
- 2) Classification of objects/materials based on physical properties (e.g., weight/mass, volume, magnetic attraction)
- 3) Forming and separating mixtures
- 4) Familiar changes in materials (e.g., decaying, burning, rusting, cooking)
- 5) Common energy sources/forms and their practical uses (e.g., the Sun, electricity, water, wind)
- 6) Light (e.g., sources, behavior)
- 7) Electrical circuits and properties of magnets
- 8) Forces that cause objects to move (e.g., gravity, push/pull forces)

C. Earth Science

- 1) Water on Earth (location, types, and movement) and air (composition, proof of its existence, uses)
- 2) Common features of Earth's landscape (e.g., mountains, plains, rivers, deserts) and relationship to human use (e.g., farming, irrigation, land development)
- 3) Weather conditions from day to day or over the seasons
- 4) Fossils of animals and plants (age, location, formation)
- 5) Earth's solar system (planets, Sun, moon)
- 6) Day, night, and shadows due to Earth's rotation and its relationship to the Sun

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

TIMSS 2011 Science Topics
A. Biology

- 1) Major organs and organ systems in humans and other organisms (structure/function, life processes that maintain stable bodily conditions)
- 2) Cells and their functions, including respiration and photosynthesis as cellular processes
- 3) Reproduction (sexual and asexual) and heredity (passing on of traits, inherited versus acquired/learned characteristics)
- 4) Role of variation and adaptation in survival/extinction of species in a changing environment
- 5) Interdependence of populations of organisms in an ecosystem (e.g., energy flow, food webs, competition, predation) and the impact of changes in the physical environment on populations (e.g., climate, water supply)
- 6) Reasons for increase in world's human population (e.g., advances in medicine, sanitation), and the effects of population growth on the environment
- 7) Human health (causes of infectious diseases, methods of infection, prevention, immunity) and the importance of diet and exercise in maintaining health

B. Chemistry

- 1) Classification, composition, and particulate structure of matter (elements, compounds, mixtures, molecules, atoms, protons, neutrons, electrons)
- 2) Solutions (solvent, solute, concentration/dilution, effect of temperature on solubility)
- 3) Properties and uses of common acids and bases
- 4) Chemical change (transformation of reactants, evidence of chemical change, conservation of matter, common oxidation reactions - combustion, rusting, tarnishing)

C. Physics

- 1) Physical states and changes in matter (explanations of properties in terms of movement and distance between particles; phase change, thermal expansion, and changes in volume and/or pressure)
- 2) Energy forms, transformations, heat, and temperature
- 3) Basic properties/behaviors of light (reflection, refraction, light and color, simple ray diagrams) and sound (transmission through media, loudness, pitch, amplitude, frequency, relative speed of light and sound)
- 4) Electric circuits (flow of current; types of circuits - parallel/series; current/voltage relationship) and properties and uses of permanent magnets and electromagnets
- 5) Forces and motion (types of forces, basic description of motion, effects of density and pressure)

D. Earth Science

- 1) Earth's structure and physical features (Earth's crust, mantle and core; composition and relative distribution of water, and composition of air)
- 2) Earth's processes, cycles, and history (rock cycle; water cycle; weather patterns; major geological events; formation of fossils and fossil fuels)
- 3) Earth's resources, their use, and conservation (e.g., renewable/nonrenewable resources, human use of land/soil, water resources)
- 4) Earth in the solar system and the universe (phenomena on Earth - day/night, tides, phases of moon, eclipses, seasons; physical features of Earth compared to other bodies; the Sun as a star)

chemistry topics, four of the five physics topics, and all four of the earth science topics were included in the curriculum for all students. However, there were a number of countries where none of the topics in a content area were included in the eighth grade science curriculum for all students, including Lebanon and the Ukraine (no biology), Georgia and Qatar (no chemistry), Morocco and Québec, Canada (no physics), and Tunisia (no earth science).

Collaborate to Improve Teaching

Part of creating a school learning environment focused on academic success involves a staff that collaborates on curricular activities. For example, a study including a comprehensive theoretical review and a meta-analysis of studies about professional communities indicated a small but positive effect of professional communities on student achievement (Lomos, Roelande, & Bosker, 2011). Because teacher collaboration with colleagues is important in building a professional community, TIMSS 2011 included the Collaborate to Improve Teaching scale. Although the idea of teacher collegiality and collaboration can involve a variety of theoretical perspectives and terms, the TIMSS 2011 scale was designed to focus on the idea of collaboration for the purpose of improving teaching. Therefore, the scale was based on how often teachers interacted with other teachers regarding each of five areas:

- ◆ Discuss how to teach a particular topic;
- ◆ Collaborate in planning and preparing instructional materials;
- ◆ Share what I have learned about my teaching experiences;
- ◆ Visit another classroom to learn more about teaching; and
- ◆ Work together to try out new ideas.

Students were scored according to their teachers responses, with **Very Collaborative** teachers having interactions with other teachers at least “one to three times per week” in each of three of the five areas and “two or three times per month” in each of the other two, on average.

Exhibit 8.12 presents the results for the fourth grade. In general, most science teachers of fourth grade students reported a high degree of collaboration with other teachers with the goal of improving teaching and learning. Internationally, on average, about one-third of the fourth grade students (35%) had **Very Collaborative** teachers. Another 53 percent of students, on average, had teachers that reported being **Collaborative** (e.g., interacting two or three times a month for all areas). Few fourth grade students (12%, on average) had

Exhibit 8.12: Collaborate to Improve Teaching

Reported by Teachers

Students were scored according to their teachers' responses to how often they interacted with other teachers in each of five teaching areas on the *Collaborate to Improve Teaching* scale. Students with **Very Collaborative** teachers had a score on the scale of at least 11.0, which corresponds to their teachers having interactions with other teachers at least "one to three times per week" in each of three of the five areas and "two or three times per month" in each of the other two, on average. Students with **Somewhat Collaborative** teachers had a score no higher than 7.3, which corresponds to their teachers interacting with other teachers "never or almost never" in each of three of the five areas and "two or three times per month" in each of the other two, on average. All other students had **Collaborative** teachers.

Exhibit 8.13: Collaborate to Improve Teaching

Reported by Teachers

Students were scored according to their teachers' responses to how often they interacted with other teachers in each of five teaching areas on the *Collaborate to Improve Teaching* scale. Students with **Very Collaborative** teachers had a score on the scale of at least 11.4, which corresponds to their teachers having interactions with other teachers at least "one to three times per week" in each of three of the five areas and "two or three times per month" in each of the other two, on average. Students with **Somewhat Collaborative** teachers had a score no higher than 7.5, which corresponds to their teachers interacting with other teachers "never or almost never" in each of three of the five areas and "two or three times per month" in each of the other two, on average. All other students had **Collaborative** teachers.

Centerpoint of scale set at 10.

(.) Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

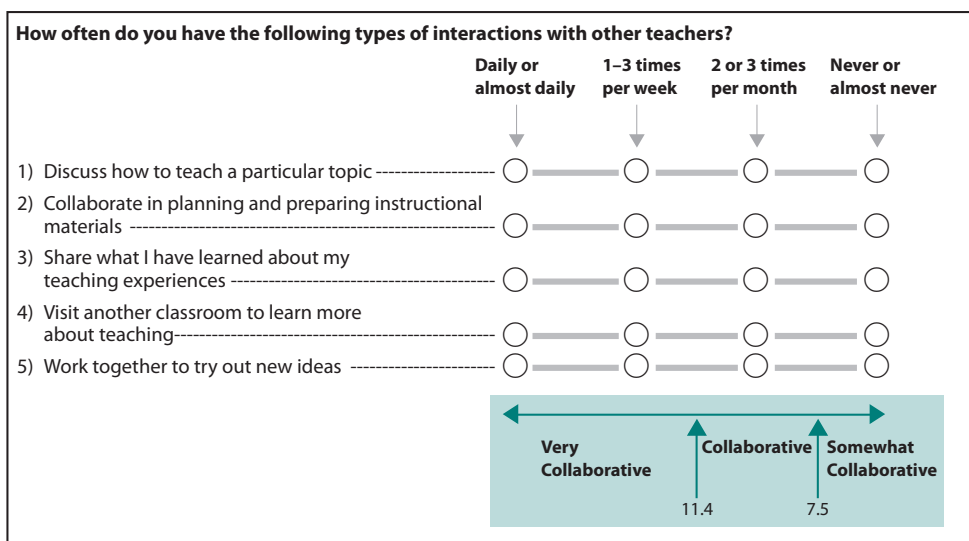

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

An "x" indicates data are available for less than 50% of students.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

science teachers that were only **Somewhat Collaborative** (e.g., never or almost never interacting in three of the five areas).

Looking across the countries at the fourth and sixth grades as well as the benchmarking participants, it is clear that there are differences from country to country. However, primarily these differences were between the percentages of students with **Very Collaborative** and **Collaborative** teachers, although they had the same achievement (487), on average.

Exhibit 8.13 presents the teacher collaboration results for the eighth grade. The science teachers of eighth grade students reported a degree of collaboration with other teachers comparable to their colleagues at the fourth grade. Nearly one-third of the eighth grade students (29%) had **Very Collaborative** teachers and another 58 percent had **Collaborative** teachers, with 13 percent having only **Somewhat Collaborative** teachers. Just like at the fourth grade, eighth grade students had essentially the same average science achievement whether their teachers were **Very Collaborative** or **Collaborative** (476 and 479, respectively). In general, the ninth grade and benchmarking students also had teachers that reported a considerable amount of collaboration with other teachers. According to TIMSS 2011 reports from teachers, almost all students have the benefit of teachers who collaborate with other teachers to improve instruction.

Instruction to Engage Students in Learning

Historically, educational studies, including TIMSS, have struggled to link student achievement to instructional activities. Typically, teachers are asked to report how frequently they use various instruction activities and strategies, and such information can be very useful. However, in light of the growing body of evidence about the complexities of teaching and learning, researchers are beginning to understand these lists of activities cannot be used as proxies for the characteristics of good teaching.

To help build a better bridge between curriculum and instruction, TIMSS 2011 collected information about the concept of student content engagement as described by McLaughlin, McGrath, Burian-Fitzgerald, Lanahan, Scotchmer, Enyeart, and Salganik (2005). According to this work, supported by the U.S. National Center for Education Statistics, student content engagement focuses on the importance of the activity that brings the student and the subject matter content together. Engagement refers to the cognitive interaction between the student and instructional content, and may take the form of listening to the teacher or providing an explanation of a problem solution. It is the student's in-the-moment cognitive interaction with instructional content.

To measure aspects of student content engagement, TIMSS 2011 developed both a teacher scale, called the Engaging Students in Learning scale, and a student scale called the Engaged in Science Lessons scale.

Exhibit 8.14 presents the fourth grade results for the Engaging Students in Learning scale. The scale contains six items related to teachers' instructional practices intended to interest students and reinforce learning:

- ♦ Summarizing the lesson's learning goals;
- ♦ Relating the lesson to students' daily lives;
- ♦ Questioning to elicit reasons and explanations;
- ♦ Encouraging students to show improvement;
- ♦ Praising students for good effort; and
- ♦ Bringing interesting materials to class.

Students were categorized according to their teachers' responses, with **Most Lessons** corresponding to teachers who used three of the six practices in "every or almost every lesson" and the other three in "about half the lessons," on average.

Many fourth grade students, 71 percent on average, internationally, had teachers that made efforts to engage them in instruction by using a variety of strategies in **Most Lessons**, and most of the remaining students had teachers that used engaging instructional practices in **About Half the Lessons** (with a few exceptions). Although the fourth grade students whose teachers used engaging instruction in **Most Lessons** had somewhat higher average science achievement than other students, the pattern varied considerably across the fourth grade, sixth grade, and benchmarking participants.

Exhibit 8.15 presents the eighth grade results based on a somewhat shorter Engaging Students in Learning scale. At the eighth grade, two items were removed from the scale because relatively small percentages of students had teachers that frequently related lessons to students' daily lives, and even smaller percentages had teachers that routinely brought interesting materials to class (see Exhibit 8.16). Perhaps eighth grade teachers should make greater efforts to make science relevant to students' daily lives and provide interesting materials, especially in light of the drop by the eighth grade in students' liking science learning. On the other hand, teachers in some of the highest achieving countries reported the least use of these instructional practices.

Exhibit 8.14: Instruction to Engage Students in Learning

Reported by Teachers

Students were scored according to their teachers' responses to how often they used each of six instructional practices on the *Engaging Students in Learning* scale. Students with teachers who used engagement practices in **Most Lessons** had a score on the scale of at least 9.1, which corresponds to their teachers using three of the six practices "every or almost every lesson" and using the other three in "about half the lessons," on average. Students with teachers who used engagement practices in **Some Lessons** had a score no higher than 6.0, which corresponds to their teachers using three of the six practices in "some lessons" and using the other three in "about half the lessons," on average. All other students had teachers who used engagement practices in **About Half the Lessons**.

Centerpoint of scale set at 10.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

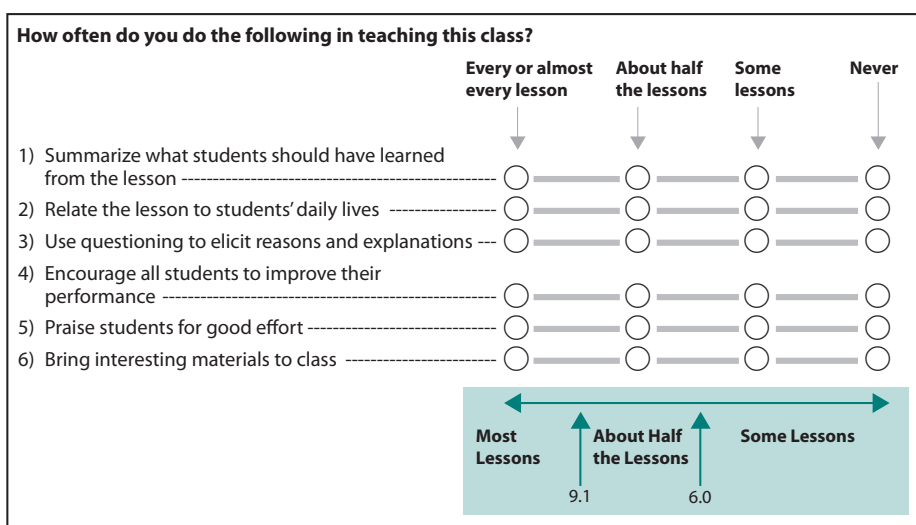

Exhibit 8.15: Instruction to Engage Students in Learning

Reported by Teachers

Students were scored according to their teachers' responses to how often they used each of four instructional practices on the *Engaging Students in Learning* scale. Students with teachers who used engagement practices in **Most Lessons** had a score on the scale of at least 8.7, which corresponds to their teachers using two of the four practices "every or almost every lesson" and using the other two in "about half the lessons," on average. Students with teachers who used engagement practices in **Some Lessons** had a score no higher than 5.7, which corresponds to their teachers using two of the four practices in "some lessons" and using the other two in "about half the lessons," on average. All other students had teachers who used engagement practices in **About Half the Lessons**.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

Based on the shorter four-item scale, on average, 80 percent of the eighth grade students had teachers that reported using engaging practices in most lessons, and almost all of the rest had teachers that reported using engaging practices in about half the lessons. Across the eighth grade, ninth grade, and benchmarking participants, students often had somewhat higher average science achievement if their teachers used engaging instruction in **Most Lessons** rather than **About Half the Lessons**.

Exhibits 8.17 and 8.18 present the results for the TIMSS 2011 Engaged in Science Lessons scale that looks at engagement from the student perspective. This scale asks how much students agree with the following five statements:

- ◆ I know what my teacher expects me to do;
- ◆ I think of things not related to the lesson (reverse coded);
- ◆ My teacher is easy to understand;
- ◆ I am interested in what my teacher says; and
- ◆ My teacher gives me interesting things to do.

Students considered to be **Engaged** had a score on the scale corresponding to “agreeing a lot” with at least three of the statements and “agreeing a little” with the other two, on average. Being in the **Not Engaged** category was based on a scale score corresponding to, at most, “agreeing a little” with no more than two statements and “disagreeing a little” with the other three, on average. All other students were considered to be **Somewhat Engaged**.

At the fourth grade, internationally, on average, 45 percent of students reported being **Engaged** during their science lessons, another 47 percent reported being **Somewhat Engaged**, and only 8 percent reported being **Not Engaged**. Across the fourth grade, sixth grade, and benchmarking participants, there was a positive relationship between students’ reports about being more engaged and average science achievement. **Engaged** students had higher achievement than their counterparts who reported being only **Somewhat Engaged**, and students **Not Engaged** had the lowest achievement (504 vs. 476 and 457, respectively).

At the eighth grade, internationally, on average, smaller percentages of students than at the fourth grade reported being engaged in their science lessons. In countries teaching general or integrated science, only 29 percent of the eighth grade students, on average, reported being **Engaged** during their science lessons. The majority (51%) reported being **Somewhat Engaged** and 21 percent reported being **Not Engaged**. For the general or integrated science countries, there was a direct relationship between student engagement and average science achievement—the more engaged students reported being, the higher their average science achievement; and this held across the eighth grade, ninth grade, and across benchmarking participants. Among the separate science subject countries, students reported somewhat more engagement in biology and earth science lessons (33% and 31% **Engaged**, respectively) than in chemistry and physics lessons (26% and 27% **Engaged**, respectively). In each of the science subjects, students reporting being engaged in their lessons had higher science achievement than those who were only somewhat or not engaged.

Exhibit 8.17: Students Engaged in Science Lessons

Reported by Students

Students were scored according to their degree of agreement with five statements on the *Engaged in Science Lessons* scale. Students **Engaged** in science lessons had a score on the scale of at least 10.1, which corresponds to their “agreeing a lot” with three of the five statements and “agreeing a little” with the other two, on average. Students who were **Not Engaged** had a score no higher than 7.4, which corresponds to their “disagreeing a little” with three of the five statements and “agreeing a little” with the other two, on average. All other students were **Somewhat Engaged** in science lessons.

How much do you agree with these statements about your science lessons?

* Reverse coded

Exhibit 8.18: Students Engaged in Science Lessons

Reported by Students

The general/integrated science panel summarizes responses for countries where students are enrolled in science as a single subject. The remaining panels for biology, chemistry, physics, and earth science summarize responses for countries where students are taught science as separate subjects.

For general/integrated science, students were scored according to their degree of agreement with five statements on the *Engaged in Science Lessons* scale. Students **Engaged** in science lessons had a score on the scale of at least 11.2, which corresponds to their “agreeing a lot” with three of the five statements and “agreeing a little” with the other two, on average. Students who were **Not Engaged** had a score no higher than 8.4, which corresponds to their “disagreeing a little” with three of the five statements and “agreeing a little” with the other two, on average. All other students were **Somewhat Engaged** in science lessons. For biology, chemistry, physics, and earth science, a comparable procedure was used.

Centerpoint of scale set at 10.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A dash (–) indicates comparable data are not available.

An “r” indicates data are available for at least 70% but less than 85% of the students.

Students Ready to Learn

Instruction Limited by Students Lacking Prerequisite Knowledge or Skills

The characteristics of the students themselves can be very important to the classroom atmosphere. To begin, students need the prerequisite science skills before they can make gains in achievement. Because prior knowledge guides learning, effective science teachers assess students' knowledge, skills, and conceptual understanding, and link new ideas, skills, and competencies to prior understandings. Lack of prerequisite knowledge and skills are psychological barriers to further science learning, because it is well known that students' new learning depends on that prior knowledge: "Every new thing that a person learns must be attached to what the person already knows" (McLaughlin et al., 2005, p. 5).

Exhibit 8.19 presents teachers' reports at the fourth grade about whether their science instruction was limited by students lacking prerequisite knowledge or skills. On average, internationally, 28 percent of the fourth grade students were in classes where students had the necessary prerequisite skills for science instruction to proceed according to teachers' plans, and 60 percent were in classes where instruction was limited to some extent. It is consistent with teachers' reports that the students in classes where instruction was progressing unimpeded had higher average science achievement than did their counterparts in classes where instruction was limited to some extent (501 vs. 485). Also consistent with teachers' reports, average science achievement was substantially lower (460) for the fourth grade students in classrooms where instruction was limited "a lot" because students lacked the prerequisite knowledge or skills. This overall pattern also was evidenced at the sixth grade and for the benchmarking participants.

Exhibit 8.20 presents teachers' reports at the eighth grade about whether their science instruction was limited by students lacking prerequisite knowledge or skills. On average, internationally, just 20 percent of the eighth grade students were in classes where students had the necessary prerequisite skills for science instruction to proceed according to teachers' plans. According to their teachers, 61 percent were in classes where instruction was limited to some extent and 19 percent in classes where instruction was limited "a lot." As students progress through school, the curriculum becomes increasingly advanced and, not surprisingly, greater percentages of students fall behind, which typically results in some differentiation in instruction for different groups of students. Especially, taking into account some type of tailored curriculum and instruction

for groups of students, it is distressing that, according to their teachers, relatively few students at the eighth grade are receiving the full instructional benefit that could be provided.

Eighth grade students in classes where instruction was not limited had higher average science achievement than did their counterparts in classes where instruction was limited to some extent (496 vs. 478). Also consistent with teachers' reports, average science achievement was substantially lower (455) for eighth grade students in classrooms where instruction was limited "a lot" because students lacked the prerequisite knowledge or skills. This pattern also was evidenced at the ninth grade and for the benchmarking participants.

Instruction Limited by Students Suffering from Lack of Nutrition or Sleep

The importance of a healthy breakfast is widely advertised, including the benefit of doing better in school. Unfortunately, some children in many countries around the world suffer from hunger, and a growing body of research, mostly in developing countries, is providing evidence that malnutrition has a negative impact on educational achievement. Similarly, a number of studies in a variety of countries have shown sleep duration and quality to be related to academic functioning at school. For example, a Dutch researcher found that chronic sleep reduction can affect school achievement directly and indirectly via motivation and engagement (Meijer, 2008).

Exhibit 8.21 presents teachers' reports at the fourth grade about the degree to which their science instruction was limited by students' lack of nutrition or not having enough sleep. On average, internationally, 71 percent of the fourth grade students were in classrooms where instruction was "not at all" limited because students were lacking in basic nutrition. These fourth grade students had higher average science achievement than their peers in classrooms where instruction was limited "some" or "a lot" due to lack of basic nutrition (493 vs. 467). It is of considerable concern that 29 percent of the fourth grade students, on average, were reported to be suffering from lack of basic nutrition; and this percentage is much higher in some countries, including those that participated at the sixth grade.

Teachers reported that 54 percent of the fourth grade students, on average, were in classrooms where instruction was "not at all" limited by students suffering from not enough sleep. However, it is unfortunate that 46 percent,

on average, were in classrooms where instruction was limited “some” or “a lot” by students suffering from lack of sleep. The achievement gap for sleep deprivation was somewhat less than that related to lack of nutrition, but the fourth grade students suffering from some amount of sleep deprivation did have lower average science achievement than their more alert counterparts (by 11 points on average). Again, there was considerable variation across countries in teachers’ reports about the percentages of fourth grade students suffering from not enough sleep. According to their teachers, in a number of TIMSS 2011 countries and benchmarking participants, the majority of students were at least somewhat sleep deprived.

Exhibit 8.22 presents the eighth grade teachers’ reports about the degree to which their instruction was limited by students’ lack of nutrition or not having enough sleep. On average, internationally, 64 percent of the eighth grade students were in classrooms where instruction was “not at all” limited because students were lacking in basic nutrition. These eighth grade students had higher average science achievement than their peers in classrooms where instruction was limited “some” or “a lot” due to lack of basic nutrition (485 vs. 461). More than one-third (36%) of the eighth grade students, on average, were reported to be suffering from lack of basic nutrition; and this percentage was much higher in some countries, including those that participated at the ninth grade.

Teachers reported that 42 percent of the eighth grade students, on average, were in classrooms where instruction was “not at all” limited by students suffering from not enough sleep. However, again, it is a matter of considerable concern that the majority of eighth grade students (58%), on average, were in classrooms where instruction was limited “some” or “a lot” by students suffering from lack of sleep. Similar to the results at fourth grade, the achievement gap for sleep deprivation was somewhat less than that related to lack of nutrition, but the eighth grade students suffering from some amount of sleep deprivation did have lower average science achievement than their counterparts (by 11 points). Again, there was considerable variation across countries in teachers’ reports about the percentages of eighth grade students suffering from not enough sleep. According to their teachers, however, in a number of TIMSS 2011 countries and benchmarking participants, as much as two-thirds of students were at least somewhat sleep deprived.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

A tilde (~) indicates insufficient data to report achievement.

An "r" indicates data are available for at least 70% but less than 85% of the students. An "s" indicates data are available for at least 50% but less than 70% of the students.

Instruction Limited by Disruptive or Uninterested Students

The importance of classroom management and maintaining a positive and productive classroom environment is widely recognized as central to high-quality teaching (Bill & Melinda Gates Foundation, 2010). Yet, even the most experienced and effective teachers can encounter discipline problems.

Exhibit 8.23 presents teachers' reports about the extent to which their fourth grade classroom instruction in science was limited by disruptive or uninterested students. As good news, internationally, on average, teachers reported their instruction was rarely limited by either disruptive or bored students, with 87 to 89 percent of the fourth grade students in classrooms with some or no problems. However, the 11 to 13 percent of students in classrooms with a lot of student behavior problems did have lower average science achievement (from 16–26 points). Across the fourth grade, sixth grade, and benchmarking participants there was some variation in teachers' reports about disruptive and uninterested students. In general, however, teachers reported that their fourth grade students around the world appear relatively well behaved and attentive during their science lessons.

Exhibit 8.24 presents teachers' reports about the extent to which their eighth grade classroom instruction in science was limited by disruptive or uninterested students. Internationally, on average, teachers reported their instruction was limited "some or not at all" by disruptive students for 83 percent of the students and by bored students for 79 percent of the students. Although most of the eighth grade students were in science classrooms with attentive students, the 17 to 21 percent of students in classrooms with "a lot" of student behavior problems had lower average science achievement (from 19–26 points). Across the eighth grade, ninth grade, and benchmarking participants there was some variation in teachers' reports. Compared to the fourth grade, however, boredom appears to be an emerging problem in science classes at the eighth grade. It is difficult to know whether students are bored because they cannot do the science, or whether they just find science boring.

Classroom Resources and Activities for Teaching Science

Resources Teachers Use for Teaching Science

Exhibit 8.25 contains teachers' reports about the classroom materials used for teaching science at the fourth grade. On average, internationally, textbooks were used most often as the basis for science instruction, for 70 percent of the fourth grade students, and workbooks or worksheets were used the next most often, for 41 percent of the students. Science equipment and materials were used as the basis of instruction for 36 percent of the fourth grade students, and relying on computer software was relatively rare, used for only 11 percent of the students, on average. Teachers reported that all of the materials TIMSS asked about were used to some extent as supplementary resources for science instruction at the fourth grade, with science equipment and materials the most popular, used with 60 percent of the students, followed by workbooks or worksheets used with 56 percent of the students, on average. Teachers reported using computer software as a supplementary resource for 53 percent of the fourth grade students, on average.

As shown in Exhibit 8.26, textbooks also were the most frequent basis of science instruction at the eighth grade, used with 74 percent of the students internationally, on average. However, in contrast to the fourth grade, science equipment and materials were the next most frequently reported basis for instruction, used with 43 percent of the eighth grade students. Workbooks or worksheets were less frequently used than at the fourth grade (35% of students on average) but still heavily used in some countries. Computer software was more frequently reported as a basis for instruction than at the fourth grade, but was not used with many students—only 16 percent, on average. All of the following materials except textbooks were popular as supplementary instructional resources at the eighth grade: workbooks or worksheets, with 60 percent of students; science equipment and materials, with 54 percent; and computer software, with 61 percent.

Teacher Emphasis on Science Investigation

As noted in the TIMSS 2011 Science Assessment Framework, one of the ways in which students have been encouraged to build upon their knowledge and understanding of science is through the process of scientific inquiry, and, as documented in the *TIMSS 2011 Encyclopedia*, the contemporary science curricula of many countries place considerable emphasis on engaging students in this process. For example, the most recent recommendations for effective instructional practices of the US National Research Council include an emphasis on inquiry activities (National Research Council, 2011). A recent meta-analysis across 138 studies indicated that using some level of inquiry-based instruction had a positive relationship with student understanding and retention of science content. In particular, instruction emphasizing active thinking and drawing conclusions from data or providing hands-on experience with scientific phenomena were associated with increased likelihood of scientific understanding (Minner, Levy, & Century, 2009).

Previous TIMSS studies have presented teachers' reports about the frequency with which they engaged in a range of inquiry-related activities. TIMSS 2011 takes this approach further, using IRT scales to summarize teacher reports at the fourth and eighth grades. The Emphasize Science Investigation scale at the fourth grade is based on teacher reports of how often, in teaching science, teachers ask students to engage in the following six activities:

- ◆ Observe natural phenomena such as the weather or a plant growing and describe what they see;
- ◆ Watch me (the teacher) demonstrate an experiment or investigation;
- ◆ Design or plan experiments or investigations;
- ◆ Conduct experiments or investigations;
- ◆ Give explanations about something they are studying; and
- ◆ Relate what they are learning in science to their daily lives.

Exhibit 8.27 presents the results for the fourth grade assessment. Students were categorized according to their teachers' responses, with **About Half the Lessons or More** corresponding to teachers who used all six activities in "about half the lessons," on average. All other students had teachers who emphasized science investigation in **Less than Half the Lessons**. As shown in the exhibit, teachers of science at the fourth grade vary widely across countries in their use of inquiry activities, with the percentage of students taught by teachers emphasizing science investigation in **About Half the Lessons or More** ranging from 4 percent in Norway to 80 to 86 percent in Iran and Tunisia. On average across the fourth grade countries, 40 percent of students were taught by teachers emphasizing science investigation in half to the lessons or more, and 60 percent had teachers emphasizing investigation less frequently. This pattern was similar among the sixth grade and benchmarking participants. There was no relationship between emphasis on science investigation and average science achievement.

Exhibit 8.28 presents the results for the eighth grade on the Emphasize Science Investigation scale, which includes the six instructional activities from the fourth grade scale and one additional activity more suited to eighth grade students: "Use scientific formulas and laws to solve routine problems." Compared to the fourth grade, there was greater use of investigation in science instruction, with almost half of the students (48%) taught by teachers emphasizing investigation in **About Half the Lessons or More**. Although on average across countries, science achievement was somewhat higher among students whose teachers more frequently emphasize inquiry activities (479 vs. 474), both the frequency of inquiry activity use and its relationship with science achievement varied considerably across the eighth grade, ninth grade, and benchmarking participants.

Reported by Teachers

Students were scored according to their teachers' responses to how often they used each of six instructional activities on the *Emphasize Science Investigation* scale. Students with teachers who emphasized science investigation in **About Half the Lessons or More** had a score on the scale of at least 10.7, which corresponds to their teachers using all six activities in "about half the lessons," on average. All other students had teachers who emphasized science investigation in **Less than Half the Lessons**.

Reported by Teachers

Students were scored according to their teachers' responses to how often they used each of seven instructional activities on the *Emphasize Science Investigation* scale. Students with teachers who emphasized science investigation in **About Half the Lessons or More** had a score on the scale of at least 10.2, which corresponds to their teachers using all seven activities in "about half the lessons," on average. All other students had teachers who emphasized science investigation in **Less than Half the Lessons**.

Country	About Half the Lessons or More		Less than Half the Lessons		Average Scale Score

Computer Activities During Science Lessons

According to the *TIMSS 2011 Encyclopedia*, countries are investing in technology as a way to enhance teaching and learning. Availability of computers and other technology in the science classroom can facilitate successful implementation of the curriculum. For example, as described in the Contextual Framework chapter of the *TIMSS 2011 Assessment Frameworks*, computers and the Internet provide students ways to explore concepts in-depth, trigger enthusiasm and motivation for learning, enable students to learn at their own pace, and provide students with access to vast information sources.

Besides giving students access to the Internet, computers can serve a number of other educational purposes. While initially limited to learning drills and practice, they are now used in a variety of ways including tutorials, simulations, games, and applications. New software enables students to pose their own problems and explore and discover mathematics and scientific properties on their own. Computer software for modeling and visualization of ideas can open a whole new world to students and help them connect these ideas to their language and symbol systems. A recent study summarizing 25 meta-analyses determined that computer use in the classroom has a significant positive effect on achievement at all grade levels and in all subjects (Tamim, Bernard, Borokhovski, Abrami, & Schmidt, 2011).

Exhibit 8.29 contains teachers' reports about the prevalence and types of computer-based activities used as part of science instruction at fourth grade. The range of computer availability across countries was very large, from 7 percent of the students in Iran to 85 percent in New Zealand. Internationally, on average, less than half (47%) of the fourth grade students had computers available during their science lessons. Average science achievement was equivalent between those fourth grade students with computers available and those without computers available.

Teachers reported that 24 to 25 percent of the fourth grade students, on average, were asked to use a computer at least monthly to do scientific procedures or experiments or to study natural phenomena through simulations. Somewhat larger percentages were asked to use a computer at least monthly to look up ideas and information (41%) and to practice skills and procedures (31%). The range in computer availability across the benchmarking participants reflected the fourth grade results across countries. However, the students participating at the sixth grade had less access to computers for science instruction than did the fourth grade TIMSS students, on average.

At the eighth grade, reports about computer availability and use were similar to those at the fourth grade (see Exhibit 8.30). Internationally, on average, less than half (46%) of the eighth grade students had computers available during their science lessons, ranging from 12 percent in Ghana to 84 percent in Kazakhstan. Students with computers available during their lessons had slightly higher science achievement than students without computers available. Approximately one-third (28–39%) of the eighth grade students, on average, were asked to do the following on at least a monthly basis: look up ideas and information, do scientific procedures or experiments, study natural phenomena through simulations, process and analyze data, and practice skills and procedures. As would be anticipated, computer use in science lessons varied considerably across countries at the eighth grade, as well as for the benchmarking participants. Countries participating at the ninth grade had less computer availability, including South Africa, Botswana, and Honduras.

Science Homework

Homework is a way to extend instruction and assess student progress. TIMSS has consistently shown that the amount of homework assigned for mathematics and science varies both within and across countries. In some situations, homework is assigned typically to students who need it the most to keep up to their classmates. In other situations, students receive homework for practice or as an enrichment exercise. Because of the different approaches and policies associated with assigning homework, it generally shows mixed results in relation to average student achievement.

The eighth grade students in TIMSS were asked how often their teacher gives homework in science (or biology, chemistry, physics, and earth science for separate science countries) and how much time they usually spend on it when it is given. Weekly time on science homework was estimated by multiplying the frequency of assignment by the amount of time spent. Exhibit 8.31 presents the results, with countries ordered by the percentage of students reporting they spent 3 hours or more per week. However, spending as much time as this on science homework was relatively rare. Among countries teaching science as general or integrated subject, the range was from a high of 11 percent of students in Malaysia to 1 percent in England and Korea and to zero in Japan. It should be mentioned that although students in several of the high-performing East Asian countries report relatively small amounts of homework, many of them attend special tutoring schools.

On average, internationally, only 5 percent of the eighth grade students reported doing as much as 3 hours of science homework per week, and these students had the lowest average science achievement. The majority of students (67%) reported doing 45 minutes or less of weekly science homework, and a further 29 percent reported doing more than 45 minutes but less than 3 hours—these students had the highest average science achievement. Both Botswana and South Africa at the ninth grade had relatively high percentages of students reporting 3 hours of science homework per week, although the percentages for benchmarking participants were more comparable to the international averages at eighth grade.

For each of the four science subjects, eighth grade students in separate science countries reported about the same amount of homework as students in general or integrated science countries reported for science overall. This means, of course, that the total time spent on science homework by students in separate science countries is a lot more than in general or integrated science

Exhibit 8.31: Weekly Time Students Spend on Science Homework

Reported by Students

The general/integrated science panel summarizes responses for countries where students are enrolled in science as a single subject. The remaining panels for biology, chemistry, physics, and earth science summarize responses for countries where students are taught science as separate subjects.

Weekly Time Students Spend on General/Integrated Science Homework

General/Integrated Science	3 Hours or More		More than 45 Minutes but Less than 3 Hours		45 Minutes or Less

A. How often does your teacher give you homework in <science/biology/chemistry/physics/earth science>?

- 1) Every day
- 2) 3 or 4 times a week
- 3) 1 or 2 times a week
- 4) Less than once a week
- 5) Never

B. When your teacher gives you <science/biology/chemistry/physics/earth science> homework, about how many minutes do you usually spend on your homework?

- 1) My teacher never gives me homework
- 2) 1-15 minutes
- 3) 16-30 minutes
- 4) 31-60 minutes
- 5) 61-90 minutes
- 6) More than 90 minutes

The weekly time spent on <science> homework was calculated by multiplying how often students were given homework weekly by the minutes they spent on that homework.

The values for Part A were: Every day = 5; 3 or 4 times a week = 3.5; 1 or 2 times a week = 1.5; Less than once a week = 0.5; and Never = 0.

The values for Part B were: My teacher never gives me homework = 0; 1-15 minutes = 8; 16-30 minutes = 23; 31-60 minutes = 45; 61-90 minutes = 75; and More than 90 minutes = 105.

countries. However, there was an inverse relationship between time spent on homework and average science achievement in the separate science countries, with average achievement highest among students spending 45 minutes or less on each subject.

Science Classroom Assessment

Teachers have a number of informal and formal ways to evaluate student learning. Informal assessments during instruction help teachers identify the needs of particular individuals, gauge the pace of instruction, and signal the need to adapt or reteach. Formal tests typically are used to make important decisions about the students, such as grades or marks.

Exhibit 8.32 presents teachers' reports about how often they give eighth grade students science tests or examinations. Internationally, on average, the eighth grade students were tested fairly regularly in science—35 percent at least every two weeks, and 41 percent about monthly. Just 24 percent were tested less often, approximately a few times a year.

The exhibit also contains teachers' reports about the types of questions they included in their tests and examinations. Most frequently, the test questions involved application of knowledge and understanding, which were used always or almost always for 78 percent of the students, on average, across the countries, and at least sometimes for 22 percent of the students. The test questions in science often also required students to provide explanations or justifications for their answers—almost always for 54 percent of students and sometimes for 42 percent, with only 3 percent almost never. Questions involving developing hypotheses and designing scientific investigations were used less frequently—always or almost always for 21 percent of the students, on average, sometimes for 62 percent of the students, and rarely for 17 percent of the students. However, across the eighth grade, ninth grade, and benchmarking participants, there was considerable variation in testing practices.

Exhibit 8.32: Classroom Assessment
Reported by Teachers

Country	Percentage of Students Whose Teachers Give Science Tests or Examinations			Percentage of Students Whose Teachers Give Test Questions								
				Involving Application of Knowledge and Understanding			Involving Developing Hypotheses and Designing Scientific Investigations			Requiring Explanations or Justifications		
	Every 2 Weeks or More	About Once a Month	A Few Times a Year or Less	Always or Almost Always	Sometimes	Never or Almost Never	Always or Almost Always	Sometimes	Never or Almost Never	Always or Almost Always	Sometimes	Never or Almost Never

Appendix B

Characteristics of the Items in the TIMSS 2011 Science Assessment

Appendix B.1: Distribution of Assessment Items by Content Domain, Cognitive Domain, and Item Format

TIMSS Assessment Items	Multiple-choice Items	Constructed-response Items	Total Items	Percentage of Score Points
Content Domain				
Life Science	36 (36)	39 (46)	75 (82)	45%
Physical Science	37 (37)	26 (27)	63 (64)	35%
Earth Science	20 (20)	14 (18)	34 (38)	21%
Total	93 (93)	79 (91)	172 (184)	100%
Percentage of Score Points	51%	49%		
Cognitive Domain				
Knowing	42 (42)	27 (34)	69 (76)	41%
Applying	38 (38)	33 (37)	71 (75)	41%
Reasoning	13 (13)	19 (20)	32 (33)	18%
Total	93 (93)	79 (91)	172 (184)	100%
Percentage of Score Points	51%	49%		

Score points are shown in parentheses.
Because of rounding some results may appear inconsistent.

Appendix C

Population Coverage and Sample Participation Rates

Appendix C.1: Information about the Students Assessed in TIMSS 2011

Reported by National Research Coordinators

Country	Grade 4		Grade 8		Information About Age of Entry, Promotion, and Retention
	Country's Name for Fourth Year of Formal Schooling*	Average Age at Time of Testing	Country's Name for Eighth Year of Formal Schooling*	Average Age at Time of Testing	
Armenia	Grade 4	10.0	Grade 8	14.6	Children must be 6 years old to begin school the following December 31st. The age of entry policy has changed within the past ten years. Promotion is automatic for Grades 1–5, but dependent on academic progress for Grades 6–8.
Australia	Year 4	10.0	Year 8	14.0	Varies by state, but children generally must begin school by age 6. Most children actually begin school at the minimum age of 4.5–5, and the age of entry policy has been revised within the past ten years. Policy on promotion and retention varies by state but, generally, there is automatic promotion for Grades 1–8.
Austria	Grade 4	10.3			Children must begin school in the September following their 6th birthday, but parents can request early admission for children who turn 6 by March 1st of the following year. Automatic promotion for Grade 1, but there is retention in Grades 2–4 for students failing one or more compulsory subjects.
Azerbaijan	Grade 4	10.2			Children must be 6 years old by the end of September to begin school on September 15 of that year, but children the Ministry of Education identifies as talented who are born before the end of November can begin school in September of the year they turn 6. Promotion is automatic for Grades 1–4, but is dependent on academic progress for Grades 5–8.
Bahrain	Grade 5	10.4	3rd Intermediate	14.4	Parents must register their children at school when they are 7 years old. Children must be 6 years old by the end of June to begin the following September. The age of entry policy has changed within the past ten years. Promotion is dependent upon passing Arabic, Mathematics, Science, and English.
Belgium (Flemish)	Grade 4	10.0			Children must begin school on September 1st of the year of their 6th birthday. Parents can keep their child in kindergarten until age 7, with approval. Promotion is decided by each school and/or parents; students not having fully attended preprimary education must pass a language qualification test to begin primary school.
Chile	Grade 4	10.1	Grade 8	14.2	Compulsory schooling begins at age 6. Children must be 6 years old by March 31st to begin in March of the same calendar year. Promotion is dependent on academic progress for all grades.
Chinese Taipei	Grade 4	10.2	Grade 8	14.2	Children must be 6 years old before September 1st to begin school in the September of the same calendar year. There is automatic promotion for Grades 1–8.
Croatia	Grade 4	10.7			The age of entry policy, which has changed within the past ten years, says that all children must begin school by 7 years old. Although children must be at least 6 years old by the end of March to begin the following September, children typically begin school at age 7. Student promotion is dependent on meeting minimum standards in Grades 1–8.
Czech Republic	Grade 4	10.4			Compulsory schooling begins at the beginning of the school year (September 1st) following the child's 6th birthday unless granted a postponement, which an increasing number of parents are seeking. Promotion is dependent on academic progress in all compulsory subjects, but is automatic for students who have repeated a year.
Denmark	Grade 4	11.0			Children begin preprimary education the year they turn 6 and primary education the following year. Delaying entry by a year requires municipal board approval, but parents can have their child begin a year early. This policy has changed within the past ten years. There is automatic promotion in Grades 1–8, though in special cases students may be promoted or retained based on individual assessments, with parental consent.
England	Year 5	10.2	Year 9	14.2	Children begin school the term (typically September, January, or April) of their 5th birthday. Many local authorities make provision for all children to begin in the September of the school year in which they will turn 5 and some have changed the discretionary time so that children can begin at a younger age, although all of this is subject to parental discretion. There is no policy on promotion and retention.
Finland	Grade 4	10.8	Grade 8	14.8	Children begin school the autumn of the year of their 7th birthday, although it is possible to enter school either one year earlier or one year later than the official policy, following discussions with an expert (e.g., school psychologist). There is automatic promotion for Grades 1–8, with retention only in extreme situations.
Georgia	Grade 4	10.0	Grade 8	14.2	Compulsory schooling begins at age 6 according to the Law on General Education, which has been updated within the past ten years. Promotion is automatic for Grades 1–4, and dependent on academic progress for Grades 5–8.
Germany	Grade 4	10.4			Compulsory schooling begins the year a child turns 6. Children must be at least 6 years old before a statutory qualifying date (which varies by state; in most states the date falls between June 30th and September 30th) to begin on August 1st. The official policy grants parents the right to request early admission or postponed enrollment, but the school administration has the final decision. The policy on age of entry has been revised within the past ten years. There is automatic promotion in Grade 1, and promotion policies differ between states for later grades.

* The TIMSS target population is the grade that represents four years or eight years of schooling counting from the first year of ISCED Level 1. However, IEA has a policy that students do not fall under the minimum average age of 9.5 years old (Fourth grade) or 13.5 years old (Eighth grade) at the time of testing, so England, Malta, and New Zealand assessed students in their fifth year or ninth year of formal schooling.

Appendix C.1: Information about the Students Assessed in TIMSS 2011 (Continued)

Country	Grade 4		Grade 8		Information About Age of Entry, Promotion, and Retention
	Country's Name for Fourth Year of Formal Schooling*	Average Age at Time of Testing	Country's Name for Eighth Year of Formal Schooling*	Average Age at Time of Testing	
Ghana			Junior High School Form Two	15.8	Children begin school the calendar year of their 6th birthday. Promotion is automatic in Grades 1–6 and dependent on academic progress for Grades 7–9. Promotion is mostly automatic in public schools.
Hong Kong SAR	Primary 4	10.1	Secondary 2	14.2	Children begin school the September after they turn 5 years, 8 months old. Representatives of the Education Bureau may prescribe a maximum rate of repetition.
Hungary	Grade 4	10.7	Grade 8	14.7	Children begin school during the calendar year they turn 6 if their birthday is before May 31st; however, children may begin during the calendar year of their 6th, 7th, or 8th birthday at parental request. Promotion is automatic in Grades 1–3, and dependent on academic progress for Grades 4–8.
Indonesia			Grade 8	14.3	Children must be 7 years old by the end of June to begin on July 12th, although parents have some choice in starting children at age 6. Promotion is dependent on academic progress for Grades 1–8.
Iran, Islamic Rep. of	Grade 4	10.2	Grade 8	14.3	Children must be 6 years old by September 22nd to begin school September 23rd, although there are few private schools that allow registration at 6.5 years. Students with failing grades in June must take a cumulative exam in September to determine promotion or retention.
Ireland	Fourth Class	10.3			The Education (Welfare) Act of 2000 requires children to attend primary schools from the time that they are 6 years old but not before they are 4. In practice, nearly half of 4-year-olds and almost all 5-year-olds are enrolled in infant classes in primary schools. Children only are allowed to repeat a year for educational reasons and in exceptional circumstances.
Israel			Grade 8	14.0	The official policy is that children begin school the calendar year of their 6th birthday, but parents have the final say if they feel their children are not ready to begin. There is retention only in exceptional cases.
Italy	Grade 4	9.7	Grade 8	13.8	Children begin school the calendar year of their 6th birthday, but parents can enroll children who will turn 6 years old by April 30th of the following calendar year in the calendar year of their 5th birthday. The age of entry policy has been revised within the past ten years. Promotion is dependent on academic progress for Grades 1–8.
Japan	Grade 4	10.5	Grade 8	14.5	Compulsory schooling begins at age 6, and children must be 6 years old by April 1st to start school. There is no policy for promotion and retention.
Jordan			Grade 8	13.9	Compulsory schooling begins at 6 years old. Children must be at least 5 years, 8 months old by September 1st to begin school. Promotion is dependent on academic progress in Arabic and mathematics for Grades 1–3, with parental consent, and dependent on academic progress for Grades 4–8. Students should not repeat a grade more than twice.
Kazakhstan	Grade 4	10.4	Grade 8	14.6	According to the Law of Education (2007), children must begin school at age 6, though parents can postpone enrollment for one year. The age of entry policy has changed within the past ten years. Promotion is dependent on academic progress for Grades 1–4, and dependent on successfully passing exams for Grades 5–8.
Korea, Rep. of	Grade 4	10.4	Grade 8	14.3	Children begin school during the calendar year of their 6th birthday, and must be 6 years old by the end of December to begin school in March of that year. Parents can decide to send their children a year later (at age 7), for health reasons, or a year early (at age 5). Promotion is dependent on academic progress and attendance for Grades 1–8.
Kuwait	Grade 4	9.7			Children must be 6 years old by March 15th to begin school that calendar year, and children typically begin primary school at age 5.5 or 6. Promotion is automatic for Grades 1–3 and dependent on academic progress for Grades 4–8.
Lebanon			Grade 8	14.3	Children must be 6 years old by the end of June to begin school the following September, although in public schools, special cases may be authorized by the Ministry of Education. Promotion is automatic for Grades 1–6 and dependent on academic progress for Grades 7–8.
Lithuania	Grade 4	10.7	Grade 8	14.7	Children must begin school by the calendar year of their 7th birthday, but parents can enroll children one year early if the child satisfies the requirements of the Ministry of Education and Science. The age of entry policy has been revised within the past ten years. There is no national policy on promotion and retention; decisions are made at the school level.
Macedonia, Rep. of			Grade 8	14.7	Since 2007, children must be 6 years old by the end of December to begin school the following September. Before 2007, children had to be 6 years old by the end of May to begin school the following September. Promotion is automatic for Grades 1–5 and dependent on academic progress for Grades 6–8.
Malaysia			Form 2	14.4	Children begin school at the beginning of January of the calendar year of their 6th birthday. There is no policy for promotion and retention.
Malta	Year 5	9.8			Children begin school in late September of the calendar year of their 5th birthday. Students repeat a class only in exceptional circumstances in primary school and on the basis of their academic performance and other factors in exceptional circumstances in secondary school. Students can be retained only once during each education cycle.

Appendix C.1: Information about the Students Assessed in TIMSS 2011 (Continued)

Country	Grade 4		Grade 8		Information About Age of Entry, Promotion, and Retention
	Country's Name for Fourth Year of Formal Schooling*	Average Age at Time of Testing	Country's Name for Eighth Year of Formal Schooling*	Average Age at Time of Testing	
Morocco	Grade 4	10.5	Grade 8	14.7	Children must be at least 5 years, 6 months old by the beginning of September to begin school, and parents rarely postpone the start. Promotion depends on academic progress for both primary and secondary grades.
Netherlands	Group 6	10.2			Children must begin kindergarten on the first school day of the month after their 5th birthday. Most children begin kindergarten when they turn 4 and primary education at age 6, although some children begin primary education a year later at age 7. Promotion and retention are decided by the school, dependent on academic progress.
New Zealand	Year 5	9.9	Year 9	14.1	Children must be enrolled in school by their 6th birthday but have the right to begin school at age 5, and nearly all children begin school on or soon after their 5th birthday. There is automatic promotion, with retention only in very special circumstances with school and parental input.
Northern Ireland	Year 6	10.4			Children must be 4 years old by July 1st to begin school in September. The majority of children start and continue with their age group, but some transfer to post-primary a year late or early.
Norway	Grade 4 (4. trinn)	9.7	Grade 8 (8.trinn)	13.7	Children must begin school the calendar year of their 6th birthday. There is automatic promotion for all grades.
Oman	Grade 4	9.9	Grade 8	14.1	Children begin school the year of their 6th birthday. Children must be at least 5 years, 9 months old at the start of the academic year (beginning of September), but parents can enroll their children in private schools where the official entry age is 5 years, 5 months. The age of entry policy has been revised within the past ten years. Promotion is automatic for Grades 1–4 and dependent on academic progress for Grades 5–8.
Palestinian Nat'l Auth.			Grade 8	13.9	Children must be 5 years, 9 months old by the beginning of the September in which they enroll. Parents can enroll children in private schools two months earlier than public schools. Promotion is automatic for Grades 1–3 and dependent on academic progress for Grades 4–8. A maximum of 5% of students in each class may be retained.
Poland	Grade 3	9.9			Children must begin school the calendar year of their 7th birthday, but parents can postpone the beginning of school for medical or psychological reasons. The age of entry policy has been revised within the past ten years. Parental consent is required for retention in Grades 1–6, and promotion is dependent upon academic progress in higher grades.
Portugal	Grade 4	10.0			Children must begin school the year of their 6th birthday if they turn 6 years old by September 15th. Parents can enroll children who turn 6 years old by the end of December, depending on school availability. The age of entry policy has been revised within the past ten years. Promotion is automatic for Grade 1, and dependent on academic progress for Grades 2–8.
Qatar	Grade 4	10.0	Grade 8	14.0	Children must begin school in the September of the calendar year of their 6th birthday, but parents can enroll their children in private schools where the official entry age is 5 years, 5 months. Promotion is dependent on academic progress for Grades 1–8.
Romania	Grade 4	10.9	Grade 8	14.9	According to the law of education, which has been revised within the past ten years, children must begin school at age 6, although parents can postpone enrollment for one year. Promotion is automatic for Grade 1, and dependent on academic progress for Grades 2–8.
Russian Federation	Grade 4	10.8	Grade 8	14.7	Children must be at least 6 years, 6 months old by the end of August to begin school in September but typically begin at age 7. Promotion is automatic for Grade 1 and dependent on academic progress for Grades 2–8.
Saudi Arabia	Grade 4	10.0	Intermediate Year 2	14.1	Children must begin school the calendar year of their 6th birthday. There is no policy on promotion and retention.
Serbia	Grade 4	10.8			Children must begin school between the ages of 6.5 and 7.5 years old. Schools may recommend one year of continued preparatory preschool for children not considered school ready. The age of entry policy has changed within the past ten years. Promotion is automatic for Grade 1 and generally automatic for Grades 2–3, except by parental request. In Grades 4–7, students failing 2 or more subjects must pass makeup exams.
Singapore	Primary 4	10.4	Secondary 2	14.4	According to the Compulsory Education Act, children must begin school the calendar year of their 7th birthday, although parents may seek a deferral of registration based on medical grounds. There is automatic promotion for Grades 1–4; retention is at principal's discretion for Grade 5 and dependent on academic progress for Grades 6–8.
Slovak Republic	Grade 4	10.4			Children must begin school in September if they turn 6 years old by August 31st. Children may begin school early or after an approved delay, based on psychological tests and professional recommendations. Promotion is dependent on academic progress. Students failing 1–2 required subjects must pass a makeup exam; students failing more than 2 are retained.
Slovenia	Grade 4	9.9	Grade 8	13.9	Children must begin school the calendar year of their 6th birthday, but some children who are 6 years old in January enter school in the September of the calendar year before they turn 6. The age of entry policy has been revised within the past ten years. Generally, there is automatic promotion for Grades 1–8, except for students with learning difficulties.

Appendix C.1: Information about the Students Assessed in TIMSS 2011 (Continued)

Country	Grade 4		Grade 8		Information About Age of Entry, Promotion, and Retention
	Country's Name for Fourth Year of Formal Schooling*	Average Age at Time of Testing	Country's Name for Eighth Year of Formal Schooling*	Average Age at Time of Testing	
Spain	Primary Education Year 4	9.8			Children must begin school the calendar year of their 6th birthday. Almost every child begins kindergarten at the age of 3 even though it is not compulsory. Students can be retained for 1 year during Grades 1–6, but students with special needs can be retained twice. Students that don't reach the goals in Grades 7 and 8 can be retained in both grades.
Sweden	Grade 4	10.7	Grade 8	14.8	Children begin school in the fall of the calendar year of their 7th birthday but can begin the year they turn 6 or 8 years old for special reasons. There is automatic promotion for all grades.
Syrian Arab Republic			Grade 8	13.9	Children must begin school the September following their 6th birthday. Promotion for Grades 1–8 is based on academic progress, but promotion is automatic when a student fails a grade for the second time.
Thailand	Primary 4	10.5	Middle School 2	14.3	Children must begin school by the year of their 7th birthday, but can begin at the age of 6. There is no policy for promotion and retention.
Tunisia	Year 4 of Primary Education	10.0	Year 8 of Basic Education	14.3	Children begin school in the September of the calendar year of their 6th birthday. Younger children are accepted if there are school vacancies in the area where they live. Promotion is dependent on academic progress in Arabic, French, mathematics, and science for Grades 1–6, and dependent on academic progress for Grades 7–8.
Turkey	Grade 4	10.1	Grade 8	14.0	Children begin school in September of the calendar year of their 6th birthday, although they can begin a year later, at parental discretion. Promotion is automatic for Grades 1–3 and dependent on academic progress for Grades 4–8.
Ukraine			Grade 8	14.2	Compulsory schooling begins at age 6. Children must be at least 6 years old by September 1st to begin school, and parents can decide if children begin school at age 6 or 7. Retention is decided by parents, and students can take external examinations to advance into higher grade levels.
United Arab Emirates	Grade 4	9.8	Grade 8	13.9	Children can begin school when they are 5.5 years old. Parents or guardians can decide when children begin school, but it must be by age 8. The age of entry policy has been revised within the past ten years. Students in Grades 1–5 are subject to remedial instruction for promotion, and promotion in Grades 6–8 is dependent on academic achievement.
United States	Grade 4	10.2	Grade 8	14.2	Varies by state, but children commonly begin kindergarten at age 5 (by parental choice) and typically begin primary school at age 6 (by law).
Yemen	Grade 4	11.2			Children can begin school the year of their 6th birthday, but some flexibility exists at the discretion of the school's director. Promotion is automatic for Grades 1–3 and dependent on academic progress for Grades 4–8.

Out of Grade Participants

Botswana	Standard 6	12.8	Form 2	15.8	Children must be 6 years old by the end of June to begin school in the January of the same calendar year, but children from remote areas may begin school later than age 6. There is up to 12.5% retention in each class and accelerated progression is possible after parent consultation.
Honduras	Grade 6	12.7	Grade 9	15.7	Children must be 7 years old by the end of January to begin school the following February, but about 30% of children typically begin primary school at age 6, per principals' decisions. Promotion is dependent on academic progress on exams prepared and administered by teachers.
South Africa			Grade 9	16.0	Children must be 6 years old by June 30th of the year in which they enroll and children are encouraged to begin at age 7. The age of entry policy has been revised within the past ten years. In principle, students should progress with their age cohort. The norm for repetition is one year per school phase where necessary.
Yemen	Grade 6	13.2			Children can begin school the year of their 6th birthday, but some flexibility exists at the discretion of the school's director. Promotion is automatic for Grades 1–3 and dependent on academic progress for Grades 4–8.

Appendix C.1: Information about the Students Assessed in TIMSS 2011 (Continued)

Country	Grade 4		Grade 8		Information About Age of Entry, Promotion, and Retention
	Country's Name for Fourth Year of Formal Schooling*	Average Age at Time of Testing	Country's Name for Eighth Year of Formal Schooling*	Average Age at Time of Testing	
Benchmarking Participants					
Alberta, Canada	Grade 4	9.9	Grade 8	13.9	The law requires all children who are 6 years old by September 1 to attend school, although school boards may set their own age requirements for entering school, and many allow children to enter Grade 1 if they are 6 years old by March 1 of the following year. Parental discretion or choice is allowed. School principals make promotion decisions in line with school policies.
Ontario, Canada	Grade 4	9.8	Grade 8	13.8	Children must attend school in September if they turn 6 years old by September 1 but also have the right to attend school in September if they will turn 6 by December 31 of that calendar year. Parents may choose to enroll their children in junior kindergarten at age 4 or senior kindergarten at age 5. School principals make promotion decisions, appealable to the school board.
Quebec, Canada	Grade 4	10.1	Secondary 2	14.2	Children must be 6 years old by September 30th to begin school in the September of that calendar year. School boards determine promotion and the Ministry sets rules for obtaining diplomas.
Abu Dhabi, UAE	Grade 4	9.7	Grade 8	13.8	Children must be 6 years old by October 1st of the school year in which they enroll. Parents sometimes place students in private schools that accept younger students, then transfer them to the public system. The age of entry policy has changed within the past ten years. There is automatic promotion in Grades 1–5 except in special cases and with parental consent. Promotion is dependent on academic progress in Grades 6–8.
Dubai, UAE	Grade 4	9.8	Grade 8	13.9	Children can begin school the calendar year of their 5th birthday. The policy on promotion and retention varies by school type.
Alabama, US			Grade 8	14.4	According to the code of Alabama 1875 Section 16-28-3, children must begin school at age 7, and typically children actually do begin at age 7. The age of entry policy has changed within the past ten years. There is no policy for promotion or retention.
California, US			Grade 8	14.1	California law requires a child to be 6 years old on or before December 2 for the 2011-12 school year to enter Grade 1. However, the cut-off date for entry is in the process of being moved earlier by several months (California Education Code Section 48010). Although kindergarten is not required, most parents and guardians choose to enroll their children in kindergarten. There is no policy for promotion and retention.
Colorado, US			Grade 8	14.2	Children 6 years old on or before August 1st are required to begin school during that calendar year. Parents may opt to send their children to private or parochial schools or home school them if they choose not to meet the state policy. The age of entry policy has changed within the past ten years. Promotion and retention policies are decided by local education agencies.
Connecticut, US			Grade 8	14.1	Children must begin school by the time they are 7 years old. A 4-year-old may enroll in preprimary education (kindergarten) at the beginning of a school year (August or September) if he or she will turn 5 on or before January 1 of that school year. Some parents elect to delay school enrollment for younger children, and state law allows this practice provided students are enrolled in school when they are 7 years of age. Promotion and retention decisions are made locally at the district or school level.
Florida, US	Grade 4	10.4	Grade 8	14.4	Florida law (Section 1003.21 (1) (a)) specifies that children who are 6 or who will be 6 by February 1st of that school year are required to attend school. If a child enters public school at age 6 without completing kindergarten, they will be placed in kindergarten. Children who have attained the age of 5 on or before September 1 of the school year are eligible for admission to public kindergarten during that school year based on rules prescribed by the school board. Statewide, students are retained after Grade 3 if they do not pass the state reading assessment. Otherwise, policies for promotion and retention are determined by districts, based on academic performance.
Indiana, US			Grade 8	14.4	Children are not required to be in school until the school year in which they turn 7 years old. Children must be 5 years old on or before August 1st to begin kindergarten during that calendar year. Students are retained after Grade 3 if they do not pass the state reading assessment.
Massachusetts, US			Grade 8	14.2	Each child must attend school beginning in September of the calendar year in which he or she turns 6. Each school committee may establish its own minimum permissible age for school attendance, provided that such age is not older than the state mandatory minimum age (established by state law 603CMR 8.00). There is no policy for promotion and retention.
Minnesota, US			Grade 8	14.3	Compulsory schooling begins at age 7. Children must be at least 5 years old by September 1st to begin kindergarten, or 6 years old by September 1st to begin Grade 1 (MN Statute 120A.20). Any school board may establish a policy for admission at an earlier age. There is no policy for promotion and retention.
North Carolina, US	Grade 4	10.2	Grade 8	14.2	Compulsory schooling begins at age 7. If the child is 5 years old on or before August 31st the child is eligible to begin kindergarten. The statute recognizes that some students will be presented for enrollment who can be more appropriately served at a higher grade level, and it authorizes the school principal to make such decisions. There is no policy for promotion and retention.

¹ National Target Population does not include all of the International Target Population.

² National Defined Population covers 90% to 95% of National Target Population.

³ National Defined population covers less than 90% of National Target population (but at least 77%).

^a Exclusion rates for Azerbaijan and Georgia are slightly underestimated as some conflict zones were not covered and no official statistics were available.

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as “withdrawn.”

Students with a disability or language barrier that prevented them from participating in the assessment were classified as “excluded.”

Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as “absent.”

Students attending a sampled class at the time the sample was chosen but leaving the class before the assessment was administered were classified as “withdrawn.”

Students with a disability or language barrier that prevented them from participating in the assessment were classified as “excluded.”

Students not present when the assessment was administered, and not subsequently assessed in a make-up session, were classified as “absent.”

TIMSS guidelines for sampling participation: The minimum acceptable participation rates were 85% of both schools and students, or a combined rate (the product of school and student participation) of 75%. Participants not meeting these guidelines were annotated as follows:

† Met guidelines for sample participation rates only after replacement schools were included.

‡ Nearly satisfied guidelines for sample participation rates after replacement schools were included.

‡ Did not satisfy guidelines for sample participation rates.

* Represents years of schooling counting from the first year of ISCED Level 1

^a Age in 2011 lower due to educational reforms.^b Schools in South Ossetia and Abkhazia were excluded due to lack of access and absence of official statistics. Abkhazia refugee schools in other territories of Georgia were included in the sample frame.^c Bahrain in 2011, Korea in 2003, Lithuania in 1999, and Dubai (UAE) in 2007 tested the same cohort of students as other countries, but later in the assessment year.

A dash (–) indicates comparable data not available.

United Arab Emirates	7 (0.4)	38 (0.3)
United States	1 (0.1)	57 (0.4)
✱ Yemen	39 (1.5)	17 (0.4)

* Students were considered to have achievement too low for estimation if their performance on the assessment was no better than could be achieved by simply guessing on the multiple choice assessment items. However, such students were assigned scale scores (plausible values) by the achievement scaling procedure, despite concerns about their reliability.

✱ Average achievement not reliably measured because the percentage of students with achievement too low for estimation exceeds 25%.

Ψ Reservations about reliability of average achievement because the percentage of students with achievement too low for estimation does not exceed 25% but exceeds 15%.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

Appendix F

The Test-Curriculum Matching Analysis—Science

TIMSS went to great lengths to ensure that comparisons of student achievement across countries would be as fair and equitable as possible. The *TIMSS 2011 Assessment Frameworks* were designed to specify the important aspects of science that participating countries agreed should be the focus of an international assessment of science achievement, and the assessment items were developed through a collaborative process with national representatives to faithfully represent the specifications in the frameworks and field tested extensively in participating countries. Finalizing the TIMSS 2011 assessments involved a series of reviews by representatives of the participating countries, experts in science, and testing specialists. At the end of this process, the National Research Coordinators (NRCs) from each country formally approved the TIMSS 2011 assessments, thus accepting them as being sufficiently fair to compare their students' science achievement with that of students from other countries.

Although the assessments were developed to represent an agreed-upon framework and were intended to have as much in common across countries as possible, it was unavoidable that the match between the TIMSS 2011 assessment (or test) and the science curriculum would not be the same in all countries. To restrict test items to just those topics included in the curricula of all participating countries and covered in the same sequence would severely limit test coverage and restrict the research questions that the study is designed to address. The tests, therefore, inevitably have some items measuring topics unfamiliar to some students in some countries.

The Test-Curriculum Matching Analysis (TCMA) was conducted to investigate the extent to which the TIMSS 2011 science assessment was relevant to each country's curriculum. The TCMA also investigates the impact on a country's performance of including only achievement items that were judged to be relevant to its own curriculum.¹

To gather data about the extent to which the TIMSS 2011 tests were relevant to the curricula of the TIMSS countries and benchmarking participants, NRCs were asked to examine each achievement item and indicate whether the item was in their country's intended curriculum at the grade tested (fourth or eighth grade). The NRCs were asked to choose persons very familiar with the curriculum at these grades to make this determination. In some countries, the curriculum was prescribed for a range of grades and was not explicit about what was to be covered by the end of the fourth or eighth grades. For example, in Sweden the curriculum specifies the curricular goals to be achieved by the end of the fifth and ninth grades, but does not provide a grade-by-grade specification.

¹ Because there also may be curriculum areas covered in some countries that are not covered by the TIMSS 2011 tests, the TCMA does not provide complete information about how well the tests cover the curricula of the countries.

In such situations, coordinators were asked to make the best judgment possible.² Since an item might be in the curriculum for some but not all students in a country, coordinators were asked to consider an item included if it was in the intended curriculum for more than 50 percent of the students. All TIMSS 2011 participants took part in the TCMA analysis except Bahrain, Georgia, Saudi Arabia, Honduras (sixth grade participant), and the US benchmarking states at the fourth grade, and Bahrain, Georgia, Ghana, Indonesia, Saudi Arabia, Syrian Arab Republic, Honduras (ninth grade participant), and the US benchmarking states at the eighth grade.

Exhibits F.1 through F.4 present the TCMA results for the TIMSS 2011 science test at the fourth and eighth grades. Exhibits F.1 and F.2 show the average percent correct on the science items judged appropriate by each country at the fourth and eighth grades, respectively. Exhibits F.3 and F.4 show the standard errors corresponding to the percentages presented in Exhibits F.1 and F.2.

In Exhibit F.1, the bottom row of the exhibit shows the number of items, in terms of score points, identified as appropriate in each country. At the fourth grade, the maximum number of score points in the assessment was 181 points.³ Reading along the bottom row, it can be seen that only eight participants—Singapore, Korea, Japan, Chinese Taipei, the Russian Federation, Chile, Tunisia, and Yemen—judged less than half of the science items to be included in their curricula, although interestingly, five of the eight were among the highest performers on the TIMSS 2011 assessment. Two countries, Thailand and Armenia, judged 100 percent of the items (all 181 score points) to be included in their curricula. A further 29 countries, including one sixth grade participant, and two benchmarking participants, judged 75 percent or more (136 score points) to be appropriate.

At the eighth grade, the percentage of items judged appropriate was somewhat higher; five countries and one benchmarking participant accepted 100 percent of the items (all 233 score points), and a further 23 countries, two ninth grade participants, and two benchmarking participants judged 75 percent or more (175 score points) to be appropriate. Only Morocco, with 116 score points, judged less than half of the score points to be appropriate.

Because most countries indicated that some items were not included in their intended curriculum at the grade tested, the data were analyzed

2 Exhibit 6 of the *TIMSS 2011 Encyclopedia* provides information on the grade-to-grade structure of the science curriculum for each TIMSS 2011 participant.

3 The TIMSS 2011 fourth grade science assessment contained 172 items, yielding 184 score points. However, following item review, three items were deleted, resulting in data for reporting on 169 items and 181 score points. Similarly, following item review, the 217 items and 234 score points in the eighth grade assessment were reduced to 216 items and 233 score points.

Appendix F.1: Average Percent Correct for the Test-Curriculum Matching Analysis

Based on a subset of items specifically identified by each country as addressing its curriculum

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

Appendix F.1: Average Percent Correct for the Test-Curriculum Matching Analysis (Continued)

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

Bencharking Participants																			Average Percent Correct on All Items	Country

Appendix F.2: Average Percent Correct for the Test-Curriculum Matching Analysis

Based on a subset of items specifically identified by each country as addressing its curriculum

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

SOURCE: IEA's Trends in International Mathematics and Science Study – TIMSS 2011

to determine whether the inclusion of these items had any effect on the international performance comparisons.⁴

The first column of data in Exhibits F.1 and F.2 show the average percent correct on all test items for each participant, together with its standard error. Subsequent columns show the performance of each participant on those items judged appropriate by the participant listed at the head of the column. Participants are presented in order of their performance based on average percent correct on all items, from highest to lowest. To interpret these exhibits, choosing a country and reading across its row provides the average percent correct for the students in that country on the items selected by each of the countries listed along the top of the exhibit. For example, at the fourth grade, Singapore, where the average percent correct was 77 percent on its own set of items, had 67 percent correct on the items selected by Korea, 70 percent on the items selected by Finland, 75 percent on the items selected by Japan, and so forth. The column for a country listed at the top shows how each of the other participants performed on the set of items selected as appropriate for that country's students. Using the set of items selected by the Russian Federation as an example, 58 percent of these items, on average, were answered correctly by students in Singapore, 57 percent by students in Korea, 63 percent by students in Finland, 61 percent by students in Japan, 58 percent by those in Chinese Taipei, and so forth. The shaded diagonal element in the exhibit shows how each country performed on the set of items that it selected based on its own curriculum. Thus, Russian students averaged 68 percent correct on the set of items identified by the Russian Federation for the analysis.

For each country's selected items, the international averages across participating countries are presented in the lower part of the exhibit. These show that the selection of items by the participating countries varied somewhat in average difficulty, ranging at the fourth grade from 47 percent correct for those chosen by Singapore, Korea, Hong Kong SAR, and Croatia to 55 percent correct for those chosen by the Russian Federation. Similarly at the eighth grade, the average percent correct ranged from 42 percent for those items chosen by Singapore to 47 percent for those chosen by Jordan.

Comparing the diagonal element for a country with the overall average percent correct shows the difference between performance on the set of items chosen as appropriate for that country and performance on the test as a whole. In general, countries performed better on their own item sets than on the

4 It should be noted that the science achievement presented in Exhibits F.1 and F.2 is based on average percent correct (the percentage of students in a country, averaged across all items), which is different from the average scale scores that are presented in Chapter 1.

items overall, although usually not by much. Singapore had one of the greatest differences. The average percent correct for Singapore across all fourth grade science items was 66 percent. The diagonal element shows that Singaporean students had a greater average percent correct (77 percent) across the set of items selected as appropriate for Singapore than they did overall. However, most participants had a difference of one or two percentage points between the two performance measures. In addition to Singapore, with a difference of eleven percentage points, other exceptions included Korea (a difference of 10 points), Japan and the Russian Federation (9 points), the Slovak Republic (6 points), and Chinese Taipei and Poland (5 points). At the eighth grade, the differences were generally less; the largest being in province of Alberta (5 points) and Japan, Slovenia, and Jordan (4 percentage points).

It is clear that the selection of items does not have a major effect on the relative performance among TIMSS participants. Participants that had relatively high or low performance across all the science items also had relatively high or low performance on each of the various sets of items selected for the TCMA. For example, at the fourth grade, Singapore had the highest average percent correct not only on the test as a whole, but also on all of the different item selections, with Korea, Finland, and Japan next in order of performance on practically all selections of items. Although there are some changes in the ordering of countries based on the items selected for the TCMA, most of these differences are within the boundaries of sampling error.⁵

Even when countries performed better on the items judged by them to be included in their curriculum than they did overall, their performance relative to other participants was changed little. As an example, consider the 200 score points selected by Slovenia at the eighth grade. The students in Slovenia did better on these items (58% correct) than on the test as a whole (54% correct). However, most other countries also did better on these particular items, with an international average of 46 percent correct compared with 44 percent correct overall. In general, the TIMSS participants that performed as well or better than Slovenia on the overall test also performed as well or better on the items selected by Slovenia.

The TCMA results provide evidence that the TIMSS 2011 science assessment provides a reasonable basis for comparing achievement of the participating countries and benchmarking entities. This result is not unexpected; making the assessment as fair as possible was a major consideration in test

5 Small differences in performance between adjacent countries shown in this exhibit usually are not statistically significant. The standard errors for the average percent correct statistics based on the TIMSS 2011 sample are provided in Exhibits F.3 and F.4. For any sample average shown in Exhibits F.1 and F.2, it can be said with 95 percent confidence that the corresponding value in the population falls between the sample estimate plus or minus two standard errors.

Appendix F.3: Standard Errors for the Test-Curriculum Matching Analysis

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

Appendix F.4: Standard Errors for the Test-Curriculum Matching Analysis

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

* Of the 217 items in the Science test, some extended-response items were scored on a two-point scale, resulting in 234 score points. Following item review, one item was deleted, resulting in 216 items and 233 score points.

() Standard errors appear in parentheses. Because of rounding some results may appear inconsistent.

Appendix F.4: Standard Errors for the Test-Curriculum Matching Analysis (Continued)

Read across the row to compare that country's performance based on the test items included by each of the countries across the top. Read down the column under a country name to compare the performance of the country down the left on the items included by the country listed on the top. Read along the diagonal to compare performance for each different country based on its own decisions about the test items to include.

development. The fact that the majority of countries indicated that most items were appropriate for their students means that the different average percent correct estimates were based on many of the same items. Insofar as countries rejected items that would be difficult for their students, these items tended to be difficult for students in other countries as well. The analysis shows that omitting such items tends to improve the results for that country, but also tends to improve the results for all other countries, so that the overall pattern of relative performance is largely unaffected.

Appendix G

Percentiles and Standard Deviations of Science Achievement

Country	5th Percentile	10th Percentile	25th Percentile	50th Percentile	75th Percentile	90th Percentile	95th Percentile

Appendix H

Organizations and Individuals Responsible for TIMSS 2011

Introduction

TIMSS 2011 was a collaborative effort involving hundreds of individuals around the world. This appendix acknowledges the individuals and organizations for their contributions. Given that work on TIMSS 2011 has spanned approximately four years and has involved so many people and organizations, this list may not include all who contributed. Any omission is inadvertent. TIMSS 2011 also acknowledges the students, parents, teachers, and school principals who contributed their time and effort to the study. This report would not be possible without them.

Management and Coordination

TIMSS is a major undertaking of IEA, and together with the Progress in International Reading Literacy Study (PIRLS) comprises the core of IEA's regular cycles of studies. The TIMSS assessment at the fourth grade complements PIRLS, which regularly assesses reading achievement at fourth grade.

The TIMSS & PIRLS International Study Center at Boston College has responsibility for the overall direction and management of the TIMSS and PIRLS projects. Headed by Executive Directors Drs. Ina V.S. Mullis and Michael O. Martin, the study center is located in the Lynch School of Education. In carrying out the project, the TIMSS & PIRLS International Study Center worked closely with the IEA Secretariat in Amsterdam, which managed country participation, was responsible for verification of all translations produced by the participating countries, and coordinated the school visits by International Quality Control Monitors. The IEA Data Processing and Research Center in Hamburg was responsible for processing and verifying the data submitted by the participants; Statistics Canada in Ottawa was responsible for school and student sampling activities; and Educational Testing Service in Princeton, New Jersey consulted on psychometric methodology, provided software for scaling the achievement data, and replicated the achievement scaling for quality assurance.

The Project Management Team, comprising the study directors and representatives from the TIMSS & PIRLS International Study Center, IEA Secretariat and IEA Data Processing and Research Center, Statistics Canada, and ETS met twice a year throughout the study to discuss the study's progress, procedures, and schedule. In addition, the study directors met with members of IEA's Technical Executive Group twice yearly to review technical issues.

To work with the international team and coordinate within-country activities, each participating country designates an individual to be the TIMSS

National Research Coordinator (NRC). The NRCs have the challenging task of implementing TIMSS in their countries in accordance with the TIMSS guidelines and procedures. In addition, the NRCs provide feedback and contributions throughout the development of the TIMSS assessment. The quality of the TIMSS assessment and data depends on the work of the NRCs and their colleagues in carrying out the complex sampling, data collection, and scoring tasks involved. Continuing the tradition of exemplary work established in previous cycles of TIMSS, the TIMSS 2011 NRCs performed their many tasks with dedication, competence, energy, and goodwill, and have been commended by the IEA Secretariat, the TIMSS & PIRLS International Study Center, the IEA Data Processing and Research Center, and Statistics Canada for their commitment to the project and the high quality of their work.

Funding

Funding for TIMSS 2011 was provided primarily by the participating countries. The National Center for Education Statistics of the US Department of Education was a major funding partner, providing funding under contract number ED08C00117. The content of this publication does not necessarily reflect the views or policies of the US Department of Education nor does mention of trade names, commercial products, or organizations imply endorsement by the US Government.

The financial support from Boston College is gratefully acknowledged, as well as that from the UK's National Foundation for Educational Research.
